My main issue with where I currently am is that it was hard enough getting them to agree to the grounding rod. I have considered trying to get them to allow a flag pole and try a flag pole antenna.

Like I mentioned I just passed the test so I I have my CSCE but the FCC db hasn't even been updated yet. So my experiences with HF are minimal. We have a ham group here but most of them have not had to deal with the restrictions I do, so their advice was minimal.

At this point I do not know what bands I will want to work. Right now I just have to look for a system that can be taken down at the end of the day with no trace that it was ever there. If there is a good way to set up a vertical without having to pour concrete or pounding a post into the ground where I can take the antenna down and inside at the end of the session that would be great. If I can also get something to do a few bands to experiment with that would also be great.

Topic: 30239 Message: 30267

The End-Fedz are good antennas, but are rated by the vendor as single band only. I know one person who used his multi-band, but he could never figure out why he wasn't getting good results on the other bands.

The Buddipole is a great portable antenna -- easy to put up/take down. Remember though that in the dipole configuration, V, and inverted V, it's very much NVIS because it's down low to the ground (which would explain one of the other posters was unhappy with his). As a vertical with counterpoise, L, or vertical dipole, the Buddipole does an excellent job of DXing. Same for the Buddistick and the MP-1 antennas, which are just verticals with a counterpoise.

Many people have very good results with a random length wire and a tuner. There are all sorts of stories around the net of people who have put up very thin random length wires that are practically invisible. As a horizontal, if it's high enough, it'll have good DX results.

Something similar is the inverted L. Here's a link to an article on dxzone.
http://www.dxzone.com/cgi-bin/dir/jump2.cgi?ID=19969

Check out the TAK-tenna (http://www.tak-tenna.com). Crazy thing, but I've had good results with it, especially as a vertical. It's a single band antenna, but can be loaded on other bands. Put a balun near the shack and run ladder line out to the antenna and it'll do well on multiple bands.

I know people who have put things like the Alpha Delta DX-EE antennas in their attics and managed WAS and DXCC.

By the way, someone mentioned not having very much luck with a horizontal wire antenna on FM. Most people use verticals on FM, and the difference between vertical polarization and horizontal polarization is VERY noticeable at VHF and UHF frequencies. I can see a 40+ DB difference between having my antenna vertical and having it horizontal in 2 meter FM operations.

Given that you don't know what kind of operating interests you (VHF or HF, voice or digital, etc.) and you will also have to operate in temporary mode from your home, your timing could not be better.

ARRL Field Day is 6/26 - 6/27. This would be a great opportunity for you to see some temporary antennas in use and to see / try out for yourself different modes. Granted, some of the antennas will be 'temporary' massive structures that would be much too big for your situation but if your local group is very large you could also get a chance to see some of the smaller portable antennas that have been discussed here set up in the field --- just like you will be operating at home each day in your situation (no ground rods, massive towers, etc.)

If nothing else, it would be a great hands on opportunity for you to get on the air in different modes without having to figure out / buy all of that equipment yourself. You would also have access to talk to local hams for an entire weekend. Some of them may have a buddipole or two laying around in the attic from thier pre-tower days that they could lend you. You might also be surprised how many of them have past experience with situation similar to what you are facing now.

Get a hold of your local club(s) and see what they are doing for Field Day. Go hang out with them, observe antennas and get on the air. After Field Day you would be better positioned to make the decisions you are facing.

I've heard good things about the CCD antennas http://www.ccdantennas.com/CCD/
I don't have one yet, but they're supposed to be able to run along eaves, fences, etc.
They're for 80M-40M-20M, single or 2-band models.

Hi Bryan:

Congrats on getting licensed.

I have much the same situation as you and have found several solutions.

-BuddiPole -> see http://buddipole.com
-Par End-Fedz antennas -> see http://www.parelectronics.com/index.php
-I'm in the process of checking out my nice aluminum rain gutters. I'll be joining them all together with invisible strapping to avoid discontinuities between gutter segments.
-Use either an RF ground (see ARRL yearbook) or an MFJ Artificial Ground to avoid RF in the shack.

All of this stuff can go up and down in a jiffy.

Best of luck.

Bryan,
Have a look at a site like s9antennas.com, I tend to rool my own but this site can make it rather easy if you have the bucks for the 32 foot or the 45 foot version.
I pounded in a galv pipe next to some small palms went to the local Lowes and found a small decorative fiberglass "fake" rock that sits over the pipe found some low cost green electrical wire and slit it into the grass used some pipe hanger strap to the pipe.
Electrical conduit clamps with wing nuts attach the vertical ro the pipe and I use a 4:1 going to a LDG tuner.
Everything is up and running in less the five min and when I take it down and cove with the rock no one has seen it in over a year.
if you have lawn maint drive some tent nail into the rock when they come around.
Regards.

30272. Re: [FT897] Re: FT-897D Backlighting/Illumination of keys?

Yahoo group: FT897 (2010)
Date: 2010-06-03 00:21:07 UTC
From: Michael Hughey
Topic: 30247 Message: 30272

First make sure that menu 59 (mic select) is set to RMT instead of NORMAL (stock mic). To enter a freq you have first press the # key, then the number left of decimal point, then press the D key for the rest of the numbers. Then press the # key to enter. You can change the mode (am, fm, usb....etc...) with the 5 and 6 keys. Change the band with the 7 and 8. To change a memory channel press first the # key then channel number (no leading zeroes required) then press the * key. It took me awhile to figure it all out until I read the manual starting on page 69 (Shhhhhhhh..... don't tell the other guys that I actually read the manual. I have a rep you know). I've had my FT-897D for over a year now and I just recently figured out how to use the mic up/down keys as a CW paddle (menu 26 change to MICKEY). I tried it for a few CQ calls and then changed menu 25 to REVERSE and put my dahs on the UP key and the dits on my DOWN key. It
just felt better for me and it's easier to change than plugging in a paddle to the back of the unit while the radio is in the vehicle. Again, I must swear you to secrecy on
me actually reading the manual. The SEL/DIAL key has magical powers as well. Hold it until the light turns green and you can control the volume with the little wheel on the upper right. Otherwise (light is orange) it either changes freq or memory channel. Depending on how you set the lock button, you will probably have to press it to unlock the rest of the buttons on the mic. I hope this helps a little. Remember.....
shhhhhhhhhhh!

Thanks for the replies. Sort of relieved that there's no problem with my rig, it just lacks the button back-lighting as a feature. OK.

I did get the lighted DTMF mic with it, but no matter how I set the two switches on the mic, I still don't seem able to QSY the rig with it nor enter freqs etc. I imagine there must be some menu item for that huh?

Thanks,

Phil

From: flix.martin
Topic: 30273 Message: 30273

Hello,

I wish to remote my FT-897D.
For that I need to remotely power it on and off.
Is there any way to do this ? Maybe by CAT as for TS-480's for example?

I already own one of those cheapy USB CAT interfaces but if the TRX is not on no connection is made by HRD.

Is there any software / hardware with which I could switch my ft-897d
on and off remotely ???

If not how does this FAST/power Function on the Mic work.
Is this pin grounded for 1 sec to turn the trx on and off or how is it made?

Many thanks and please excuse my lousy english :-)

I just purchased an FT-897, SN 5N6600xx. I've determind it was manufactured in Dec 2005. My plan is to mount it in a Cargo trailer my Girlfriend (KE7DOG) and I are renovating into a neighborhood ARES/CERT trailer. I have had the Freeband Mod done. (It didn't work.) Are there any suggestions as to what else I should do, or get for this unit to be efective in field/Emergency situations?

Gary KE7MQF

P.S. The multiple menu system takes some practice to get use to.

When feeding the output to a 50 ohm Dummy Load (40 mtr band) I noticed the following:

FM I get 100 watts out
AM I get a "surge" of 100 watts, then it drops down to 35~45 watts.
SSB it will first peak close to 100 watts, then drop down to 25~45 watts. (Using an MFJ-949E)
Menu #75-RF power Set is at 100.
Menu #81-SSB Mike Gain is set at 90.
Am I missing something or is this normal?

Power on FM=100 watts, AM=25 watts, SSB voice=30-35 watts is NORMAL, is using a n AVERAGE power meter to read it! You will need an active "PEAK-READING" meter, such as the BIRD#43P --This meter has batteries inside to power the peak detect circuit, which must be turned ON to read the peak power of SSB voice and AM with modulation. Your mike gain, set at 90, is too high! Reduce it to around 50, (40 to 65 is normal) and your audio is likely to improve! Apparently, you were making the common mistake of increasing mike gain to see if you would ever get to 100 watts on your power meter, but you do not have the right type of meter! Excess mike gain flattens the peaks, distorting the audio, and appears to increase power on cheap meters by doing so. Signals produced by this excess gain setting have no higher actual peak power, but they sound bad, like a cheap "CB" radio, and are poor amateur practice.-73, KC3VO, Bob Curry

Before steaming in with all guns blazing, perhaps you should read the original post!!

It was clearly stated that the ssb measurements were "using an MFJ-949E", which is indeed a Peak Reading meter.

The first 2 point are eaisly explained:

FM perfectly correct
AM the overshoot is well documented, and a 'feature' of the 897's ALC loop. The final power of 35-40W is correct as the un-modulated carrier power on AM will be about that level for 100W @100% modulation.

The SSB reading is a little more difficult to explain. With a mic gain at 90 thee should be plently of audio to fully modulate the set.

I am not familiar with exactly how the MFJ 949E does its peak detection, but perhaps your audio input is too fast on 'normal' speech to get a good peak reading; a long 'four' or 'wallllooo' might get the correct answer.

On the subjest of mic gain settings, having done quite a few measurements on my 897 and having the mic gain set as low as 50, does result in a low peak output getting nowhere near clipping, (as observed on a peak meter and on a scope, compared to a full 100W).

The ALC reading is not a good indication of actual compression of the output. If the mic gain is set so that there is just a small ammount of ALC indicated the actual PEP is well below 50W on my particular 897. Now this may be to to with individual alignment, or is could be associated with the appalling S meter response and the A to D'ing in the processor.

hi there

wonder if you have noticed if the problem is intermittant ?
wondering if its the same prob I have on 50MHz. I havent seen any other posts
on here about it. i am a keen 6m operator and have, over the last 2 summer 6m
seasons, noticed that the receiver suddenly goes quiet and all signals drop drastically in strength accordingly.
Usually either a power off and back on or doing a band change, will restore full
RX. I cant remember for sure but I think going into TX and back to RX didnt restore the RX. I havent had time to get around to tracing the fault.
NOTE: it ONLY happens on 6m and reasonably regularly ... sometimes 3-4 times in an an hour

cheers

Are you using the same antenna on both the FT-817 and the FT-897D? Do you have a tuner on the FT-897D? You need to make sure you are testing with an antenna that is resonant in the 6 meter band, and no tuner is in line.

The general MFJ approach is passive and not very accurate for PEP readings (as I've observed several times using other meters, mainly my NYE RFM 003 that contains an active circuit to measure peaks). The MFJ readings would not convince me of any problems, I'd repeat the measurement with other meters before I worried at all.

Having found the circuit of the 949E on the MFJ website, it uses a single transistor sample and hold circuit, but I cannot comment on its effectivemess.

30286. HF SSB squelch range adjustment?

Yahoo group: FT897 (2010)
Date: 2010-06-05 19:58:22 UTC
From: Spike
Topic: 30286 Message: 30286

I have done exhaustive searches of the 897 manuals, the Internet, & this group's archives, & I can find no reference to adjusting the squelch range in this radio for any other mode than FM. I seldom use FM, but I often use the squelch(on my other radios). There is not enough squelch range on the 897 to be useful even on a quite 10 meter day.

There must be a way to adjust the range of the squelch when used on HF in modes other than FM. Does anybody out there know how it's done?
I guess I'm spoiled, all my other HF radios use a syllabic "smart" type squelch.

Dennis-
I don't know about other people but I only use squelch on FM. I don't use any squelch on any other modes. Where I am, near Atlanta, there is very little noise on HF using any mode. I'm mostly CW.

Dennis,

Go into the MENU Settings and go to # 080. There you can enable or disable the squelch on the "SQL/RF" Knob on the front panel.

Hope this helps,

73es,
Dick, W3GNQ

Subject: [FT897] HF SSB squelch range adjustment?

I have done exhaustive searches of the 897 manuals, the Internet, & this group's archives, & I can find no reference to adjusting the squelch range in this radio for any other mode than FM. I seldom use FM, but I often use the squelch(on my other radios). There is not enough squelch range on the 897 to be useful even on a quite 10 meter day.

There must be a way to adjust the range of the squelch when used on HF in modes other than FM. Does anybody out there know how it's done?
I guess I'm spoiled, all my other HF radios use a syllabic "smart" type squelch.

Not I uses no tuner on the 817 nor on the 897 and this on the same antenna, tape noise is much more important on the 817, but this is may be normal?

Thank you for answers

not tuner, I am simply etonne the difference of noise band between the 897 and 817 on the same antenna?

> Dennis-
> I don't know about other people but I only use squelch on FM. I

I have no use for FM, or for VHF(except for the occasional use of 51mc).
I monitor(or scan) all the HFpack freqs from 75 meters up.
I do this several ways. #1, I have 4ea Transworld TW100 each set to one of the freqs. #2, I have have 2 TW100's monitoring 2 freqs & another one scanning. #3, I have a Harris 3200, or an SEA 222 scanning. All these radios have their own various methods of a 'smart squelch' & all do a rather good job. With multiple radios running nearly all the time, squelch becomes important.

Recently I decided to also monitor the the 10mtr HFpack freq & figured the ordinary squelch provided by the 897 would be plenty good for 10mtrs. I was wrong. Even under very quite condition the squelch threshold is at nearly full throttle. Hence the reason I asked about the procedure for adjusting the squelch range.

Now having explained all that I might ask you why you bothered to respond given that you had no useful information to contribute? Especially given that this is a very active reflector with a great deal of traffic already.

Now why would I want to disable or enable the squelch? Did you read the original question? Or even a part of the original question?

I want to ADJUST THE RANGE of the squelch so that I CAN USED IT. Never mind,PLEASE, nobody else respond to this question over the reflector. It is already too way cluttered up with traffic.

Just let this question die!

30293. Flashing Amber Battery Light

Yahoo group: FT897 (2010)
Date: 2010-06-06 03:39:53 UTC
From: Bob
Topic: 30293 Message: 30293

I just turned my FT897d on and the Batt A light starting flashing amber. According to the manual, this indicates a low battery condition. I could understand this if I had batteries in the unit but it does not have any installed. The unit is being ran off of a 70 amp astron power supply. I can switch the battery selection switch between A or B and it flashes amber in both positions. I did a master reset on the unit and they are still flashing. Has anyone else ran into this problem and if so what is the fix. The radio only has a few hours use on it and I sure would hate to have to send it back to Yaesu. Any help would be appreciated.

30294. use correct meter-(Peak Reading R.F. Power)

Yahoo group: FT897 (2010)
Date: 2010-06-06 12:55:20 UTC
From: kc3vo@aol.com
Topic: 30294 Message: 30294

I stand by my original statement! A GOOD peak-reading meter must be used to accurately read SSB voice R.F. power peaks. This means that all aspects of the meter used must be reasonably accurate and in GOOD condition, for the frequency and power being measured.-Cables, connectors, meter, meter battery/power source, and dummy load, must all be good and properly operating. The MFJ 949E is a tuner with a type of peak reading metering circuit, requiring a 12 volt source to operate in peak read mode. Was this meter properly used, with a good 12 volts applied, in "Peak MODE"? Was the frequency below 30 Mhz, into a good 50 ohm dummy load, with the tuner in BYPASS? This Tuner/Meter is not good for 6 meters or 2 /70cm signals. Accuracy is not likely to be as good as a Bird 43P, due to the less precise peak circuit used, but if properly connected/operating, it should still give close to 100 watts with 50-60% mike gain on an FT-897. If all is in order, but results are still not good, try using another Peak-Reading R.F. power meter--Borrow a Bird 43P from someone, if possible. (The Bird 43P uses internal batteries to power the peak circuit)--73, KC3VO, Bob Curry

Well, I'll be darned. That's not what they did on their older versions I'm more familiar with. It looks like simple amplification there to charge the peak reading cap, though. Catching RMS peaks might involve more :-)

circuit used,

And how do you know that this was not the case with the OP????

The message would indicate that the peak reading function was operating correctly, in that it captured the initial 100W peak. It was the subsequent lower reasings that were causing concern.

> it should still give close to 100
> watts with 50-60% mike gain on an FT-897. If all is in order,

Well that is certainly not the case with my 897, that low a mic gain only gives about 50 PEP, unless you shout at the mic; as measured on by Bird 4381, or by direct waveform comparison on a scope with a 100W cw signal.

Last night I posted a problem with my Battery light flashing amber. I thought this was very strange since there were no batteries installed in the radio. Well a few minutes later the entire radio died! I have bought 7 Yaesu radios within the last 14 months and 3 of them have died within 1 day to 70 days. I ran Icom radios for 20 years and never had to send a single radio back for repair. All of my power supplies and antenna systems are operating 100%. Has anyone else had any problems with Yaesu quality control issues. It just seems strange to have that many radios die within a short period of time. Just wanted to vent some frustration. I have to contact the customer service section to get an RA to send this thing back.

There is a maintenance boot-up. You need to download the PDF file from this site. I've forgotten what it's file name is, but I'm sure it can be Googled. It involves turning the radio off then, while pressing the A,B, C buttons, turn the radio back on. You need this maintenance mode PDF for specific instructions snd test equipment. CAUTION! Don't go fiddling with it without the PDF file and proper test equipment.

Check ALL power connections and be sure there is not a frayed wire or a bad connection somehow. Since most power wires are stranded wire, it could be the radio is "starving" for power somehow from a frayed wire or a possible mis-connection somewhere.

One final note. Go to DG2IAQ's website (do a google search - I think it is www.dg2iaq.com, but am not sure) and look through all of his postings. There is also reference to using the service menu there. You may need to get into the service menu and do some adjusting there, since it sounds to me like the radio may not have been aligned properly from the factory. This is a "normal" thing sort of, since I have seen several instances where some radio's were not properly aligned before they were sent to retailers.

I am sure you will find what you need there - Good luck!

Bobby,

I'm sorry to hear about your failed radio. Mine has been okay for over 2 years of heavy use.

I'm curious, have you ever had an electro-static discharge (ESD) from your hand to the radio when you reached for it? It happens a lot in the winter. I've experienced this where it can damage equipment in such a away that it doesn't fail immediately but will later. Sometimes a higher then average failure rate can be contributed to ESD effects. I always discharge myself to a grounded lamp before reaching for the radio on winter days. Even then I've had my radio go nuts just from the EMP! A slow discharge is best.

Just a thought. It could just be poor quality control.

Hi Steve,

To my knowledge there was no static discharge involved. When I first turned the radio on it worked normal. Then after a few minutes the chain of events took place. This is my second 897 and the first one took a lightning strike several years ago. It just seems strange that a VX150, a FT450 and now a ft897d all on differant antennas all go belly up in that short a period of time. Just have to send it back and let Yaesu deal with it.

30307. Re: HF SSB squelch range adjustment?

Yahoo group: FT897 (2010)
Date: 2010-06-07 15:26:35 UTC
From: David Okrent
Topic: 30286 Message: 30307

I'm confused. The 897D runs squelch for FM and RF gain for HF on the same knob; therefore if you set the unit to squelch on HF you have no RF gain adjustment. In my opinion not a good solution as RF gain and AF gain adjustments are needed on HF to deal with noise verses voice issues, as well as reducing gain for nearby or high power stations. So how can you get squelch and have RF gain available on HF too? My old Kenwood 440 had a separate squelch and RF gain so I could use both at the same time.

No, this rig is not that advanced, and frankly, the package is too small for the circuitry needed, which is part of the reason those rigs are a little larger in size compared to the 897. Would be a nice feature to have. There IS and bandscope that may help with what you seek.

I am selling my FT-897, with attached LDG 897 tuner, internal batteries and charger, and LDG external S-Meter.
Has MARS mod done (transmit outside of ham bands). FP-30 optional internal power supply (fits in battery space; cannot do both at once) as well.

I am hoping to get $800 for all, Shipping included, but I am negotiable.

If interested, please contact me directly at w5sv.dave@...

From: ice_berg_
Topic: 30315 Message: 30315

In everyone's experience what have you found to be the way to set up the FT-897D with one of the CAT Tuners and a PC? I know there are several options as I have ben looking at this radio for about 2 months. Now that I have my General class and have the radio on it's way (I hate UPS doesn't deliver on sat in my area) I am looking at getting set up to do computer controlled and packet.

30316. minimum DC supply voltage for a FT-897D?

Yahoo group: FT897 (2010)
Date: 2010-06-10 16:08:52 UTC
From: dk3qn
Topic: 30316 Message: 30316

Hello group,

I've searched for this info right here but "no luck".

My question:

What is the minimum DC supply voltage an FT-897D requires before
it drops out or goes "wild"?

As per the manual it should be all right as long as the supply voltage doesn't drop below 11.7 volts (spec'd 13.8 volts +/- 15%).

Anyone with a practical experience when using 12 V GEL batteries?

73, Klaus, DK3QN

30317. Re: [FT897] minimum DC supply voltage for a FT-897D?

Yahoo group: FT897 (2010)

From: Dennis
Topic: 30316 Message: 30317

It has been noted that once voltage reaches about 9v the radio starts
getting "stupid". It should be noted too that damage to the rig could
occur if voltage gets too low.

Hope this helps.

Dennis - N8BMB

30318. minimum DC supply voltage for a FT-897D?

Yahoo group: FT897 (2010)
Date: 2010-06-10 18:57:15 UTC
From: John Faughn
Topic: 30316 Message: 30318

On the practical use of Gel-cells , yes do not waster your money on a Gel-cell , unless you are doing acrobatics in an airplane .
That is what they are meant for , less performance than , a true "deep cycle" , at a higher cost .
Also generally do not run your radio on a battery alone , the idea being that like almost anything , stay away from the extremes 11.7vdc , do not remember the high end [maybe about 16v] .
Just because someone said they made something work , does not mean that is good practice .
Running almost any equipment on the extremes means shorter life .
Having something that maintains as close as possible to 13.8v , like solar panel , power supply , or battery-booster - fallows ohms law by maintaining voltage by pulling down amps .
Even though lots of equipment has low voltage shut-down , does mean you will get as long a life out of the equipment .

On this topic does anyone have anything to say about a setup of Battery+ photovoltaic cell that has worked well in the field? I'm in the US and most of the sites I have seen selling good panels seem to be in the UK or in Germany. I did se a few that looked good, something around 17V max at 2.66A. Of course that all depends on the efficiency of the cells and the amount of sun as always, I was just wondering if anyone could provide some insight from personal experience.

Hi John and Dennis, and thanks very much for your fast answers.

Reason for asking this question was as follows:

I'd been putting a review post at eham.net on the FT-897 many years ago (see there, you'll need to go way back in history there, hi).

Based on this review I was addressed by a ham fellow from a near-by club asking me about my opinion on the 897 for /p usage, a rig which I actually sold abt. 2 years ago.

So I have no way of doing any kind of "analysis" of the radio re. supply voltage behaviour any more.

He'd been running an FT-817 so far with an external 100 watt brick amp, but unfortunately "fried" his rig on his last trip. Thus, he is in a search for a replacement, which could possibly also substitute his 100w brick amp alltogether.

In order to make sure that I'll give him a fair statement, I was curious whether a 12V DC acid or GEL battery would be good enough to feed this TRX for a couple of hours of /P usage or if it needs a battery booster in order to get the voltage up to 13V + mark.

I know from experience with some other radios that an acid or GEL battery looses voltage significantly during useage (below 12V) and that quite a number of radios just don't work any more at voltages of - say - 11.5V or so.

Thus my post was primarily targeting of getting to know at which voltage level the FT-897D is "quitting" it's service.

The second intent was to get feedback on GEL etc. batteries behavior.

Thanks again for your valuable feedback.

Leaning about solar , and batteries is a subject all by its self .
More that anything , its just about the math / ohms law .
especially if you want to do correctly & save money buy putting together a system yourself .
Other wise it cost money to have someone else put it together .
There are many sources of alternative energy stuff in the US , but I can understand that , because there is so much propaganda here telling us it doesn't work , and availability is by internet only , unless you are willing to pay too much .
As an example here , MN. , Menard's and Northern Tool & others are doing the rip off thing changing 3-4 times what a panel costs , and reboxing to a made up brand .
Last time I checked [couple months ago] Menards a big box hardware store , wanted about $11 per watt , and on the internet , using the actual manufactures brand , on a resellers site , the same panel was avalable for around $2.50 per watt .
If the system is built well & not using chinezz crap , you get better power that your utility / grid .
To learn about all , get a subscription to Home Power magazine .

Search for marine solar panels - you'll find lots of products and info.

I use a small (10 Watt?) panel to keep my batteries topped up. Two 100 AH+ batteries, keeps them up around 12.7 volts.

Over the winter the batteries stayed charged - even with the weak winter sun.

No too hard to roughly calc what your energy budget will be & you can size panels accordingly.

Note that most photoelectric research seems to be in Europe, particularly Switzerland & Germany - not much interest in the US, we can just burn some more oil.

Again stay away from high / over priced anything , as soon as you look at marine , you pay at least 3x .
I do know that is gross production of energy in Europe , but would beg to differ on research etc. , 2 US companies are making $1.00 per watt panels with a new process , but they only sell to commercial power plants , they said that they were going to make avalable to retail at the end of last yr. didn't happen .
About 8 yrs. ago , the US was shipping over 75% of all solar cells made here [by both US & foreign companies] .
Again its a big subject and require personal study to do well , if no other reason , because there are some many that do what there told , and lots of misinformation .
Something as simple as batteries is a good point , Hams seem to take pride in emergency communications , but generally are vary ill informed about batteries / types / maintenance and uses .
I would give lots of links , but ever since Firefox did an update sometime back , I can not click & drag or copy & paste links .

re: alternative electricity power sources

Hi all,

I was not aware of that I was initiating such a response on alternative power sources (gr).

What I may contribute from a German perspective:

Over here in DL-land (Germany) there are 3 alternative power sources on their way:

#1: wind energy (high investment), but real. You'll find a lot of theses wind-driven tubines on high towers across Germany.

#2: tide-water generators (North-Sea), under planning, high investment

#3: solar energy, very real, a lot of private "solar farms" run by private persons (e.g. farmers with ample land to install such "farms")

Investment being subsidized by the government, fed-in power being paid by the Power-Companies; which they maybe dislike?

Recent discussions here go to cutting-back the subsidizing by 1/3rd or so.

Anyway, over here in DL-land you can find a lot of private houses with solar panels on their roofs covering all or almost all of their south-bound roofs.

BTW:

more and more of the solar panel production comes out of the PRC (i.e. "China").

Something to think about, *again*!

Take care,

Klaus, DK3QN

I have been into alt. energy for about 35 yrs. and its a pet peeve of mine , because of the bs we get from our so-called leaders that is doesn't work or its too expensive , and you can not find it locally [in most US cities] without paying 3-4 times MSRP .
As far a DL-land , I saw a program on Public-TV a while back and most of it focused on Germany , and how well it was doing there .
I remember it said that in DL-land they were producing almost 30% of electrical power with alternatives .
America is leading the world still , but leading us all into the toilet .
When our leaders want to go to war , then they need to be out front leading , then maybe , we will follow .
The toilet is not a good place to follow anyone to .
This may not be ham related , but everything is related to politics , one way or another .

From: Steve Yates
Topic: 30316 Message: 30326

In my experience, the battery will have problems at 10.5 V before the rig does. Don't let the battery go below 10.5 V while transmitting and all should be well.

The FT-897D is made to be a field portable rig. I use mine all the time with a 12V/7Ah gel cell battery with no problems. It is not good for the battery to let it drop below 10.5 V though the rig still works fine at that level. Keep the RF power output low. More power requires a higher Amp/hour rating which usually equate to lower internal resistance. Typically I'll use 5 to 20 Watts when using the battery and when I start seeing the voltage drop to 10.5 V on transmit I'll stop using the rig to protect the battery. The rig's still chugs along like it's running on 13.8 V.

73,
Steve - AA5TB

Hello group,

I've searched for this info right here but "no luck".

My question:

What is the minimum DC supply voltage an FT-897D requires before

it drops out or goes "wild"?

As per the manual it should be all right as long as the supply voltage doesn't drop below 11.7 volts (spec'd 13.8 volts +/- 15%).

Anyone with a practical experience when using 12 V GEL batteries?

73, Klaus, DK3QN

30328. Using an FC-30 on an FT-840

Yahoo group: FT897 (2010)
Date: 2010-06-10 21:02:00 UTC
From: Joe
Topic: 30328 Message: 30328

I posted this over in the FT-840 group and got no response, so I will try it here..

We have a brand new FC-30 auto-tuner that was given to us, and we have an FT-840 that was given to us. We have installed same at an older gentleman's house, in which the he has a General ticket and is confined to a wheelchair. We put up a donated Butternut HF6V antenna, which generally runs about 1.5 - 1.7 SWR. Yeasu feels there is no reason the FC-30 won't work on the FT-840 but we can't seem to get it to work.

Does anyone here have any suggestions on getting the two units to communicate? The connections are the same...an 8 pin mini din.....We would sure like to get this to work correctly for the ham. (KA7TFH).

Thanks in advance!

I use the 45 watt system available at harbor freight tools. On sale it runs $169. It works out to about $4 a watt and comes with charge controller, 3 15 watt panels and 2 CF bulbs. The charge controller has outputs for 3, 6, 9, and 12 volts and s volt meter. Also has a cigarette lighter socket. I run the 897 from a deep cycle battery hooked to the charge controller. It's cost effective and it works.

As far as minimum voltage, usually less voltage equals more current and more strain on solid state devices. I wouldn't go below 12.5 or above 14.5 volts.

I have been into alt. energy for about 35 yrs. and its a pet peeve of mine , because of the bs we get from our so-called leaders that is doesn't work or its too expensive , and you can not find it locally [in most US cities] without paying 3-4 times MSRP .
As far a DL-land , I saw a program on Public-TV a while back and most of it focused on Germany , and how well it was doing there .
I remember it said that in DL-land they were producing almost 30% of electrical power with alternatives .
America is leading the world still , but leading us all into the toilet .
When our leaders want to go to war , then they need to be out front leading , then maybe , we will follow .
The toilet is not a good place to follow anyone to .
This may not be ham related , but everything is related to politics , one way or another .

Thanks Matt. That's the one. You can get them on sale for $169 at times. I use this for portable and field day work with my 897. I'm not necessarily being green but part of my being a ham is being ready to assist in an emergency situation. Most emergencies put power at a premium. This kit is just one more option.

Hello!

We used the FT897 in IARU R1 Fieldday last week down to 9.6 Volt.
Then we changed akkumulators to avoid destroying the cells.
The same is valid for a FT857 what we used last year.

And now were getting attitude .
A couple of comments about how we get info / product , and " that's all you hear " .
Well your listening too narrowly , and I do not remember anything saying what we can talk about or not , censorship is wrong .
If your so sensitive then maybe you should not be in a public forum .
Kinda makes you " 73 " 2 faced ?
To all else , I just have a problem knuckling under to ????
Enough of that , we were talking about alternative energy .

Hi
I don't know anything about the FT-840 but here are a couple of things you might try. Some menu driven radios have a setting you have to change so that it will recognize the fact an auto tuner is on board. Also do you have the mini cable connected so the auto tuner will key the transmitter. And lastly make sure to do a continuity test on your DIN cable (The 897 needs all 8)

Hope this helps
Tom

I will be taking my Technician test and have been researching equipment quite a bit. One little antenna system I plan on investing in is the MFJ Mini-dipole (http://www.mfjenterprises.com/Search.php?searchit=HF+Sticks). The price is right. Depending on how you set it up, dipoles can be used horizontal or vertical. In vertical mode, just make sure the "hot" side is up. In the bad old days some 35 years ago, I was playing with 11 meter antennas and had wire strung all over my shack (back bedroom). Did not please the ex-XYL very much.

The current sale price (11 July 2010) is $199.00. They are bound to have had a price increase. I am going to go to their store and look at it. They are in Houston, Texas.

From: DaniloI
Topic: 30340 Message: 30340

I proudly own an FT-897/D/I and want to install a CW filter.
I understand there is a company producing a 500Hz CW "digital" filter which is claimed to be much more performing compared with the "usual" mechanical ones (like Inrad or Collins).
Is somebody aware about it? If positive, any comments on its performance in CW operations?
Thanks beforehand.

30341. minimum DC supply voltage for a FT-897D?

Yahoo group: FT897 (2010)
Date: 2010-06-10 18:22:34 UTC
From: Jon Moody
Topic: 30316 Message: 30341

HI everyone,

I always wanted to know this answer myself so I tested my FT-897D into a dummy load using an MFJ-4245MV variable DC Power supply, a Diamond antenna power/SWR meter and and EXTECH DMM. These are not laboratory instrumented measurements and I am sure that YMWV as each rig will behave slightly differently and each test setup will be slightly different. I did this test on 2 meters into a 200 watt dummy load (SWR 1.1) with the menu power setting set to 50 watts.

The receive seems to work down to 8.6 volts as measured by my FT-897D and 9.07 volts as measured by my DMM before it turns off at 8.4 volts (FT-897D) 8.75 volts (DMM). It does not turn back on until the voltage reaches 9.9 volts (FT-897D) 10.3 volts (DMM).

On transmit there is little if any power transmitted at 8.75 volts (DMM) the power meter did not move nor did the indicator on the FT-987D. At 10.3 volts (DMM) there is aproximately 40% power or 20 watts. At 11.7 volts (DMM) 11 volts (FT-897D) I have 33 watts. Full power comes on at 13.1 volts (DMM) 12.5 volts (FT-897D) indicated 49 watts on the Diamond Power/SWR meter.

Personally, I think you are asking for trouble operating the radio outside of the factory specified voltage requirements. It may work, but I think you run the risk of damaging something. I won't knowingly subject my radio to voltages outside of parameters.

Hello!

We used the FT897 in IARU R1 Fieldday last week down to 9.6 Volt.
Then we changed akkumulators to avoid destroying the cells.
The same is valid for a FT857 what we used last year.

probably shouldnt but if a company cant design some protection
circuit built into complex equipment to keep it from being harmed if
there is a sudden brownout or shutdown, i would think very little of
their equipment and engineering department especially since they are
aware in would probably be used under emergency conditions , often
without the optimum power requirements

Robert,

I agree with what you are saying about inadvertent power changes. I thought we were talking about intentionally running the rig outside the specified power requirements. A big difference IMO.

Hi Alan,

Sorry no I didn't. Please tell me more.... how would that be useful ? It would seem that you would be able to calculate the approximate current consumed from the voltage and power values. This would not work for the receive measurements though...

I am just asking in order to learn more....

Thanks

Jon,

The power supply I use (Alinco DM-330) allows me to switch the meter between voltage and current. If yours does not, you could have put your multi-meter in the circuit, providing it will handle the current load. The reason I asked was because I was curious as to whether or not the current was going up when the voltage went down. If the unit is reducing output power along with the reduction in voltage, then this may not happen. My concern with the reduced voltage is if the current goes up it could be overloading components. If someone knows differently, please set me straight.

Topic: 30328 Message: 30350

Well, I don't know anything about the FT-840, but on the -897, you have to tell the radio in the tuner menu that you are not using the ATAS and dial in TUNER. I don't know if the -840 has such a menu. Also, on the -897, you have to momentarily touch the TUNE button on the A key to wake up the tuner. I don't know if this helps at all. You could probably download the manual for free from the Yaesu site (I've downloaded several myself) and find out there maybe.

Hi
I don't know anything about the FT-840 but here are a couple of things you might try. Some menu driven radios have a setting you have to change so that it will recognize the fact an auto tuner is on board. Also do you have the mini cable connected so the auto tuner will key the transmitter. And lastly make sure to do a continuity test on your DIN cable (The 897 needs all 8)

Hope this helps
Tom

I would expect the current(I) to drop as the voltage(V) drops, since the output(W) also dropped.

The equation to use is:
W = V * I

If W were constant, I would increase, but W will be reduced with less V. R didn't get into this equation because it is constant. If R somehow dropped, I could increase.

If I've oversimplified, others will surely explain where I'm wrong.

I have a Harbor Freight Tools catalog (supposedly my last if I don't order something) with a $169 price. I bought one last weekend and I'll buy another this weekend. I took the catalog to the store and they honored it's price. Even $199 keeps it under $5 a watt.

I have used the SEC-1235M power supply for about a year and find it does all I need for my 897D and other lights/meters connected to it.
For about $135 you can't go wrong.

Replying here to the question about actual in-use operation of PV panels and AGM batteries...

On my pickup I have 2 X 64W Uni-Solar PV panels, charging a 100 Ah PowerSonic AGM battery, via a Trace (formerly Xantrex) C12 charge controller. This setup is used to provide autonomous power for radios in the event of an emergency deployment. I get around 8A charge current to the battery in full sun.

It's been used for quite a few bike races that our club provides comms for and for several Simulated Emergency Tests (SETs). The battery remains charged all the time and the battery capacity is sufficient to provide overnight power. I also have a Powerstream AGM charger that will charge the battery from the pickup alternator if needed. AGMs require a different charge protocol than regular flooded lead-acid batteries, hence the need for the Powerstream unit.

I also run a 100 Ah AGM in the house, charged via a West Mountain Radio SuperPWRGate PG40S from my 45A mains-powered DC supply. This provides me with uninterruptible power in the event of a power failure. Not uncommon during T-storm season in NC Texas.

I chose to pay the premium price for the AGMs because they would be mounted in the shack and inside the pickup and the corrosive (and explosive) outgassing of flooded cells was not acceptable in enclosed environments. The batteries are about four years old and, having been mostly operated in 'float' mode are still in excellent condition.

There's a video of the pickup at: http://tinyurl.com/3xpyka9 showing the mounting of the panels and a deployment of them. Since the video was made the charge controller and battery have been mounted permanently inside the pickup rather than carried in the back.

The Uni-Solar amorphous panels, last I heard, are no longer made; Uni-Solar having devoted their amorphous production line to BIPV fabrication. Kyocera makes a panel of about 200 watt output that I'd use if I were doing the project now.

A word about the HF 45 watt PV system. The panels work fine -- a friend of mine got some about 3 years ago -- but the controller is garbage. He replaced it with a C12 and uses the panels to maintain the charge in his 100 Ah AGM with good results.

Figuring out the battery run-time for an intended use is easy. First, figure out how many Amp-Hours (Ah) you'll use per clock hour in normal operation. Normal operation is generally calculated at 90% receive and 10% transmit.

The FT-897D, according to Yaesu, draws 1A in receive mode and 22A in transmit at 100W.

So, in 1 clock hour we're consuming (1A X .9h) + (22A X .1h) = (.9Ah + 2.2Ah) = 3.1 Ah.

Figuring our 100Ah battery at 50Ah, because we don't ever want to take the battery below 50% depth of discharge, we divide: 50/3.1 = 16.129 hours. Which is about 16 hours and 8 minutes from a fully charged battery.

Hope this info is useful.

Due to the reduced back-EMF, impedance(Z) is lower, Z takes the place of
R in an AC circuit and so, I can increase.

Topic: 30316 Message: 30361

Come now , quit telling others what to say or listen to , if you want to move on , then just bring up another question or answer .
If you do not like the discussion then just do not participate .

30362. Re: Need help with Antenna selection

Yahoo group: FT897 (2010)
Date: 2010-06-13 20:49:53 UTC
From: ice_berg_
Topic: 30239 Message: 30362

The bigger problem is the post you have to mount in the ground. Basically if I cant pick it up and take it in at the end of the day, I can't use it. If there were enough space I would just use two tripod/mast and set up a dipole but nowhere near that kind of room here.

I looked at some yagi and log antenna but most don't look like they would hold up well on a tripod mast.

Gday Alan.
I assume you mean by "pick it up and take it in at the end of the day" you are operating portable. Based on that what I do when portable is use a 30 foot squid pole held up by a steel spike in the ground. I run a SGC SG211 (good for 60 watts) that transmits into a length of 30 foot of wire held up by the squid pole. Does all I want or need and I can pack it up at the end of the day.

I have been using an Outbacker OB8 mounted on an Outpost base for portable HF. It is of course a vertical antenna which cuts down on close in contacts, but has worked extremely well for me, especially Field Day.

30365. Splitting HF & 50 MHz antennas

Yahoo group: FT897 (2010)
Date: 2010-06-14 02:33:08 UTC
From: Sean
Topic: 30365 Message: 30365

Just to clarify that I should use a diplexer to split the output from the radio to the HF antenna and to a 6 meter antenna. Should I just use a 3ft. jumper to the input of the diplexer, then connect the two different antenna feed lines to the out? Is this correct?
Thanks!

From: tomglaab
Topic: 30315 Message: 30366

> In everyone's experience what have you found to be the way to set up the FT-897D with one of the CAT Tuners and a PC?

Not sure what you're asking... there's pretty much just one way to hook the CAT cable to the computer. If you're talking about an antenna tuner, mine (LDG AT-897) has a second port so I just daisy-chain the PC, antenna tuner, and radio.

I have a USB-CAT cable, and use the FT-857 drivers in FLDIGI to control my radio. My biggest disappointment with CAT is that Yaesu doesn't let you control transmit power with it. But for tuning the radio it works just fine.

I've also used the WSJT/WSPR software with CAT to tune the radio.

30367. Bought an FT-897D today...

Yahoo group: FT897 (2010)
Date: 2010-06-13 06:34:17 UTC
From: Dave Tipton
Topic: 30367 Message: 30367

So, I bought an FT-897D today with an AT-897 Tuner, TT Mic, and it also has both the internal power supply and the dual battery packs. I currently own a SuperAntennas MP-1 portable "Screwdriver" to use with this rig. I bought it pretty much as a "Suitcase Shack" for some of the crazy road trips I get sent on for work. (In the last 3 months, I've been in 9 states including Hawaii.)

Since my travel schedule isn't likely to let up anytime soon, I'd like to get some advice on cases for this rig, along with any other suggestions anyone might have for a new owner of this particular rig. IF I do find an appropriate case for this rig, I'd like to keep it just slightly larger than the rig, but also big enough to have foam pull outs or whatever to store the MP1 if possible. (The rods are really similar in length to the depth of this radio.)

Thanks for the advice,
Dave, W5DMT

Hello Dave.
When I go portable Dave I use a Dell (D600) size computer bag. I have the 897 tuner fitted on the left hand side of the radio. I also put the microphone inside with the 897. In the accessoreis part of the bag I put the SG211 tuner, about 40 foot of coax, Cat cables. I only use the stereo inputs and outlets of the laptop to interface to the radio. I am not sure how you would get on taking the radio on board a plane (have not tried that yet). In another similar size laptop bag I take my laptops (Toughbook CF-29, Dell D610) and associated hardware.

Ok, I did not know there was a passthrough port on the LDG tuners. What about options for the data port for packet/sstv and other data modes? Are the cables for that all pretty much the same or are there some considered better than others?

Another thing I am interested in is using the PC as a DSP for audio. I found several old programs that will do it but none of them will run in modern 64bit OSes. At least not the ones I have tried so far. Are there any software DSP options that are still maintained?

I don't think Yaesu has anything to do with controlling xmit power.

"My biggest disappointment with CAT is that Yaesu doesn't let you control transmit power with it".

HRD 857/897 CAT has a slider to adjust power output on HF, 2m and 70cm.

Bill

I believe that the only LDG with the CAT port pass through is the AT897 tuner. My AT 200Pro does not have this feature.

I ran HRD and DM470 on mine with the AT897 tuner. I also used the AT200pro tuner with it and also ran HRD and DM470. The AT200 Pro worked fine through the ACC port.

From: Patrick
Topic: 30375 Message: 30375

HI I just bought off a friend an FT897D with 2 x internal batteries
i have to charger and i have done what the manual says on how to charge
the batteries, ok so i plug the charger into the charge battery socket A or B at the rear and select the A or B toggle switch on the top then i plug the DC cable from my PSU into the connectot on the charger.
Then i get a steady solid RED led in either the A or B on the front
after a few hours the solid red led changes to flashing/blinking

Can you please tell me what these both mean as i was expecting the red led to go off after a charge of 4 hours as per the manual

I HAVE AN ANTRON ANTENNA(I KNOW CHEAP ANTENNA) HOOKED TO THE 897 AND I CAN RECIEVE STATIONS CLEARLY...BUT WHEN I TRY TO WORK THEM THEY CANT HEAR...I HAVE IT HOOKED TO THE HF ANTENNA CONNECTOR...I WAS ON 10 THE OTHER NIGHT AND I COULD CLEARLY HEAR A STATION IN THE MIDWET WHO WAS TALKING TO STATIONS IN MY STATE(NEW YORK) BUT I COULDNT HEAR THE NEW YORK STATION....BESIDES GETTING A BETTER 10M ANTENNA WHAT AN I DOING WRONG?

You need to study and learn about HF propagation at different frequencies .

It is all hit and miss on 10.

Hi,

firstly, please sign your messages with name and callsign. that way we know
who to address in replies.

Second, please don't type in all upper case (capitals) it makes it much harder
to read and is often considered to be shouting.

Now, to answer your question about hearing the remote station but not the
local ones, that is basic propagation, as you are obviously in the skip zone
for the local station but are getting skip from the remote one. This means
that, for the remote station, you are located in an area where the signal
comes back to the ground from being refracted by the ionosphere (one or more
times) but you are too close to get the skip from the local station but are
also beyond the reach of the ground wave from them. Therefore you cannot
hear them.

For more information, I suggest that you read up on basic HF propagation
in the ARRL handbook or some other publication or on the net.

73....Eric VK2VE.

30378. Re: [FT897] 10 METER ISSUE

Yahoo group: FT897 (2010)
Date: 2010-06-17 00:46:27 UTC
From: Michael Hughey
Topic: 30373 Message: 30378

I worked three stations while mobile near Ft Collins, Colorado last Saturday with..... a 102 inch whip connected straight into the FT-897D with no tuner, screwed into a 4-magnet mag mount on top of my truck. I talked to Los Angeles and Tucson. My FC-30 tuner will tune it on 10m and 12m, but nothing else. I haven't tried with my MFJ-941 yet. Also, I've discovered that if I turn on the IPO (essentially turning OFF the pre-amp), I can hear signals a lot better. Also, turning on the AGC helps. Try it (the 102 inch whip), you might be surprised. It worked better on 10m than my ATAS-120. I didn't get a chance to try on 10m that night with my G5RV because the band eventually faded out. You don't have to buy a new one. You can probably find a used one at someone's garage sale or a CB shop at a truck stop.

Also, is your antenna near any metal or metal structures like a ventilation turban or other vent pipe? Things like this can cause relections and multi-pathing can occur. In the Navy we had a problem nicknamed the "rusty bolt effect". Things such as paint boats, .50 cal gun mounts, etc. would cause problems. Even a cheap antenna will perform IF it's installed right.

Flashing battery lights on the front panel usually mean that the battery charge is low. Flipping the A/B switch has no effect on charging. When the red LED on the charger goes out, that battery is fully charged.

Subject: [FT897] CAN U HELP RE CHARGING FT897D INTERNAL BATTERIES

HI I just bought off a friend an FT897D with 2 x internal batteries
i have to charger and i have done what the manual says on how to charge
the batteries, ok so i plug the charger into the charge battery socket A or B at the rear and select the A or B toggle switch on the top then i plug the DC cable from my PSU into the connectot on the charger.
Then i get a steady solid RED led in either the A or B on the front
after a few hours the solid red led changes to flashing/blinking

Can you please tell me what these both mean as i was expecting the red led to go off after a charge of 4 hours as per the manual

Just to clarify that I should use a diplexer to split the output from the radio to the HF antenna and to a 6 meter antenna. Should I just use a 3ft. jumper to the input of the diplexer, then connect the two different antenna feed lines to the out? Is this correct?
Thanks!

Many thanks Mike,
So what does the RED LED mean whn i first start
to charge the battery ? i timed it and it stayed a steady red for about 1
hour rhen it started to flash or blink and i left it charge for more thn 4
hours
plus .. and the red led did not switch off
So maybe i should leave it on charge for as long as it takes then to see
what happends

gday

The USA is in the middle of the summer Sporadic E season at the moment.

Es [sporadic e] can be very selective and can even do strange things when a ham neighbour say 5 miles away will be working stations that you cannot even copy etc.

I am not saying this was your actual problem, but Es can be S9 one minute and fade down to S1 or fade out completely in a few seconds.

My immediate thought when i read your post was "lack of propagation or unstable prop"

Es can do really weird things at times.

You should have heaps of fun on 10 metres during your Es season up there in USA

cheers from about 12000 miles south west of new york

My suggestion....Hop on down to the 11m band , where there is a ton load of radio activity and see if you are copying stations around.....
Sometimes 11m is wide open and not much activity on 10m ..... We in the carribean are hearing lots of US stations (some freq to check are 27.555 usb - 27.455 usb).
I monitor 11m to help me look for 6m opening during the Sporadic E season.

Correct Sean.
2 feeds in 1 feed out. One goes to the HF and the other goes to the 6 meters.

Hold on Sean... if there are 2 different antennas use a switch, not a diplexer. If they're 1 antenna with multi bands like 2 meters and 6 meters then you would use a diplexer. I misread your post. I use a B&W 2 position switch (manual) to switch between my 160 dipole and my G5RV.
Sorry about the mistake in my first answer, my fault.

You can use a diplexor as long as you find one that has one side dedicated to the hf antenna and the other side to the 6 M band i.e. 1 to 30 Mhz and 40 to 144 Mhz

Guys,

you can also use a diplexer the other way around and feed 2 different antennae into the one radio . I do it here myself with my 897 to split HF and 6M using a Comet CF-360.

Sure, there is a very slight insertion loss, a fraction of a dB, but it is negligible in the scheme of things. Remember that a diplexer can be used in either direction either to split 2 antennae to one radio or two radios to one antenna.

73....Eric VK2VE.

with a diplexer there is no forgetting to switch to the right antenna. I is automatic. Just dial up the 6M freq. and transmit. I my self have forgotten to switch over to the right antenna. That is when I changed to a diplexer.

I don't think it's a problem with the radio itself, but here in Florida it's a bad idea during the summer. I am watching a severe thunderstorm roll in right now with heavy lightning and even some hail. During the Winter months I leave it on.

From: Michael Hughey
Topic: 30375 Message: 30395

If I would have to guess, it may be (front panel LED) an indicator of which socket you are plugged into the back. I wait until the LED on the charger goes out. I've also successfully charged it in my truck. Yaesu documentation usually is lacking. I recently purchased an Alinco DJ-G7 and had it not been for local help, I would have never been able to program or operate it. I think the writers of the Alinco and Yaesu mauals may be close cousins.

Subject: Re: [FT897] CAN U HELP RE CHARGING FT897D INTERNAL BATTERIES

Many thanks Mike,
So what does the RED LED mean whn i first start
to charge the battery ? i timed it and it stayed a steady red for about 1
hour rhen it started to flash or blink and i left it charge for more thn 4
hours
plus .. and the red led did not switch off
So maybe i should leave it on charge for as long as it takes then to see
what happends

Subject: Re: [FT897] CAN U HELP RE CHARGING FT897D INTERNAL BATTERIES

Flashing battery lights on the front panel usually mean that the battery
charge is low. Flipping the A/B switch has no effect on charging. When the
red LED on the charger goes out, that battery is fully charged.

Subject: [FT897] CAN U HELP RE CHARGING FT897D INTERNAL BATTERIES

HI I just bought off a friend an FT897D with 2 x internal batteries
i have to charger and i have done what the manual says on how to charge

the batteries, ok so i plug the charger into the charge battery socket A or B at the rear and select the A or B toggle switch on the top then i plug the DC cable from my PSU into the connectot on the charger.
Then i get a steady solid RED led in either the A or B on the front
after a few hours the solid red led changes to flashing/blinking

Can you please tell me what these both mean as i was expecting the red led to go off after a charge of 4 hours as per the manual

Hello
Thanks for the answers.

Dual watch isn't listening simultaniously to both frequencies, which would be perfect. But it switched every five seconds, if the squelch opens. This was described earlier:

Message 28330 Re: [FT897] Re: Dual Receive Active

Bo:

This should be the indication for the "Dual Watch" feature in which the
radio periodically checks an alternate frequency. See pages 15, 49, and
50 in the operating manual for more information. It is, however, not a
simultaneous "dual receive" function as is found in some other units.

Chuck - N8DNX

You can use A/B witch to monitor the dx-Spot, but don't tune the DX frequency (like 14.195 or 21.024 on A VFO).

From: iceberg iceberg
Topic: 30315 Message: 30397

Ok, I guess I haven't gotten a clear answer to what Im looking for. So to start off with these are the things I'm looking to do:

psk31
pactor1
rtty
sstv
PC side DSP of incoming audio
PC side DSP/Shaping of outgoing audio(multi mic for noise reduction)
FULL PC Control of the 897D
Eventually satellite uplink/control though possibly not with the 897D I don't know.

I will also be looking into working with some people on some new digital modes.

Now, what I have looked at:

Rigblaster Pro
Tigertronics SL-1+

I dont know what else is out there hardware wise and what is most compatible with most software and what hardware is going to be easiest to write new software for.

I appreciate any input.

Bryan,

I use the Signalink USB sound card interface; pretty much plug and play after you open the unit and install a couple of jumpers as per their instructions. A friend of mine uses both the Signalink and the Rigblaster, he seems to do fine with the Rigblaster as well.
Signalink goes for about USD$100.
For computer control I use Ham Radio Deluxe. It doesn't do full control of the 897, but it is adequate for me.
Digitally I use mostly winmor (winklink.org) for e-mail w/o using the internet and for peer to peer.
For PSK31, etc. I use Fldigi.
We're planning to do PSK31 using an 857 w/Rigblaster this Saturday on field day.

Hope I was of some help.

Yeas, hit helps quite about. What about DPS processing with a sound cad? Have you tried this? Is there even any software that will let you do it that runs on modern 64bit only computers?

I have the ability to run Window7 64bit but mostly I run Snow Leopard in full 64bit mode or Ubuntu 64bit.

30400. Re: CAT/Data Tuner+PC Best Setup?

Yahoo group: FT897 (2010)
Date: 2010-06-22 11:11:04 UTC
From: JonP
Topic: 30315 Message: 30400

Be careful with the concept of DPS processing when using digital on an FT-857 or FT-897. Unfortunately, the DPS in the 857/897 is in the audio stage and not in the IF stage. As a result, the IF stage is dealing with many strong signals that are close together (especially PSK), with the result that only the strong survive. Most everything else gets overwhelmed to some extent before they even get to the DSP or the soundcard.

I've found that a 300 Hz filter (W4RT or Collins) in the IF stage makes a tremendous difference. I have the W4RT filter in my 897, and by careful tuning with the filter engaged, I can pick out quite a number of weak signals that I just can't get with the 897's built-in DSP or even with computer-based DSP. My success rate with PSK has doubled or tripled since I got the filter -- and that's over and above use of the 897's DSP capability.

Jon
KB1QBZ

P.S. My club's FD coordinator doesn't believe me yet, but I keep telling him that we're going to get more points from digital (especially PSK and RTTY) than we will from CW.

K1TAX Bob,

I occasionally have the CAT control software (HRD) to the radio (FT-897) freeze up on me. I had not been able to determine what the issue was, but since you have mentioned RFI, it is very likely that is the culprit. I have locked up a computer with RFI from a too-close 2-meter antenna before.

30405. Programming of ABC buttons

Yahoo group: FT897 (2010)
Date: 2010-06-22 09:04:28 UTC
From: dal_xaris
Topic: 30405 Message: 30405

Hi all,
I am wondering if anyone knows anything about programming the ABC keys? Please forgive me if this has been raised before, I did search the group post but couldn't locate any information.

I currently use a manual antenna tuner, and am using the ACC jack on the rear of the rig, switched to ground to send a TX request, putting the rig into tx mode and sending a CW carrier for tuning up.

I was told by someone that I can program one of the buttons to do this, but he didn't give me very specific information and to date I haven't figured it out on my own.

So if anyone can help I would be very grateful.

Cheers
Dale

Unless I'm mistaken, the interface cable for the LDG Z-100 and the 857 is exactly the same as the same (Y-ACC) as the one for the one for LDG-100 pro.

The interface cable consists of short length of 2 conductor (shield and center conductor) cable and two stereo plugs (3.5 mm) preferable one red and one black.

The wiring as follows:

shield - bottom ring to bottom ring
center conductor - red (rig side) center ring to black tip (LDG side)
The center ring on the black (LDG) side gets NO Connection
Rhe tip on the Red get NO Connection)

These are all things you can do in software regardless of the CAT control. I personally use FLDIGI for PSK and related; MultiPSK fills in the SSTV, PACTOR, and some others. If you're in a quiet room, you can skip the interface box and hold the microphone up to the computer speakers... just don't expect to type quickly with one hand. I did buy a SignaLinkUSB interface; the biggest selling point is that it has its own sound card. You don't have to worry about your system "ding!" noises going out over the air.

> FULL PC Control of the 897D

The 897D has a limited set of commands. FLDIGI, HRD, WSJT and others support them.

> Eventually satellite uplink/control though possibly not with the 897D

A ham here is using a combination of 897D and 817ND radios for satellite contacts. He uses the 897D on uplink because it has a higher output power. He uses dual CAT controls to drive the radios, and has dual serial interfaces to a two-axis rotator. The 897D can work the SSB satellites, unlike most HTs.

Just because you can hear them on 10m does not mean that they can hear you. This past weekend I was working the east coast and Great Lakes area on 10m. I use a 10 to 80M Windom dipole or my 9 band HF9V vertical. Some times one works and the other can't get through.

Do you have any loacal hams you can try a 10m contact with to see how you are doing? I presume you have the antenna tuned properly.

Also, typing in all CAPS is considered to be rude and equates to shouting on the net. Plus it is hard to read.

I had a prolific USB<-> Serial Cable that had problems with RFI. The
prolific cables are very cheap in price $5-10 on eBay. I have had no
problems with a FTDI USB<>Serial Cable and Keyspan USB<->Serial Cable. They
are more then the cheap ones, but you get what you pay for.
BTW, I live in a Apt w/ Window Mount Antenna so I am in a RF rich
environment when I transmit. ;-)

Topic: 30375 Message: 30416

I don't know if anyone else can back me up on this, but I have seen this happen with all of the Yaesu radios I own. For example, I have an FT-60R and the drop-in rapid charger. When I am charging that radio, the charging light stays on for the first several hours. As it gets close to being finished, the light blinks first rapidly and then more and more slowly until it finally turns off. I have seen this behavior with my FT-60, my VX-8 and its drop-in charger, and my FT-897D. Mine all flash as they get close to being finished and then the light turns off.

The only problem with this explanation is that eventually, my charging light turns off and I know it is finished. I don't know why yours never does.

Hi All

We need to adjust Mem/VFO knob to 1Khz for each VFO (A and B) and each band.
For ex: put VFO A in 80M band and Menu 82 in 1Khz, press "F" buton to
memorise this change, after this, change to VFO B in 80M band and go to
menu 82 and change it to 1KHz .... You need to do is for each band and
each VFO A/B for each band AND SSB mode, AM mode and FM mode.

This feature work very well.

I have same behaviour.
Using the MFJ-949E power meter to estimate transmition power, I get only 30 W on SSB, even I am using voice processor or increasing other parameters - MIC Gain, etc.
Any idea how to get the 100 W on SSB?

Tnx,

Duncan

The behavior is normal.
Power meter is reading Average power.
If you want the max reading, you have to use a "peak reading" meter.
The AM power on the 897 is about a third the max power -- 25-35 watts is typical (see manual)
100 Watts is high for the FM output. Mine is 50 Watts.

From: af2c@njdxa.org
Topic: 30278 Message: 30427

Just some basics:

The MFJ-949E is an HF tuner (1.8 - 30 MHz). It is not designed to be used or even give accurate readings above the designed frequencies. I presume that you are talking about 100 Watts FM on frequencies other than VHF.

All tests must be made into a dummy load with the tuner in a by-pass condition.

AM - The factory sets the output to about 25W. It is normal for the rig to show a momentary higher output on AM before it cuts back to the factory setting. The operative word here is "momentary."

CW - Should give you about 100W when set (I believe this menu 075)at 100% on the menu.
SSB - See above
FM - Same as above

Start setting for SSB:

AM microphone gain - menu 005 = 50
FM microphone gain - menu 051 = 26
Processor Level - menu 074 = 13
SSB Mike Gain - menu 081 = 41

A peak reading meter is nice but not necessary for SSB. A good whistle into the microphone will give you an indication of your output on SSB. Sometimes, just taking your max reading on your meter and multiplying by about 2 will give you a fair indication of Peak output.

Remember that the above settings are just places to start. There are a number of variables...Your microphone and your voice just to mention a couple.

You mentioned that you are using a microphone gain of 90! Much, much to high!

Have fun and good luck.

Jim -

I believe that he is referring to HF and 6m FM when it comes to FM output.

You are correct relative to 50W on 2m.

From: Dennis
Topic: 30278 Message: 30430

Duncan, it is customary to include your call when signing messages here as well, however, PLEASE note the following;

This has been hashed over several times with other posts as well - however, he was referring to SSB (see original post below my response).

First, the meter on ANY antenna tuner is an AVG reading - NOT accurate by any means. This is especially true for MFJ equipment. The only way to get an accurate reading is with either a test unit or a PEAK reading meter (If I remember correctly). Both meters are expensive in price for the best ones.

Second, Unless you input a steady tone into the radio (either through the mic or other way), the reading displayed on the meter will not be able to keep up with the peaks in your voice, and hence, will NOT accurately display full power on the meter.

Third, there IS NO carrier on SSB. when you speak into the mic or input a tone, that is when the power AND signal are put into the feed line and to the antenna. You can, theoretically, hold an antenna in your hands and key the mic with no burn - UNTIL a signal is put into the mic. With no signal into the mic, there is no RF produced until then.

Fourth, REGARDLESS of speech processor, mic gain, etc., SSB still has NO RF OUT until you speak into the mic or input a tone. Increasing mic gain, processor, etc. will NOT make any difference and has NO effect on power out.

Sixth, regardless of the radio make or model (all HF/6m of course), they ALL work the same way on SSB.

I don't wish to sound mean or berating, but this is BASIC radio and was covered in the study manual. Are you new to the hobby? Did you study a manual or just take practice tests until you could pass consistantly? There are 2 books I HIGHLY recommend - FOR ANYBODY - NEW ham or EXTRA CLASS;

The ARRL Handbook
The ARRL Antenna book

BOTH are EXCELLENT reading and can answer most questions related to many questions posted here, especially relating to power out and propagation problems.

Finally, remember, too, that an antenna tuner really is a "co-ax" tuner. It only fools the radio into thinking there is no SWR being reflected back and allows the radio to transmit at optimum, especially those newer radios that have the "fold-back protection" circuitry. It

does NOT tune your antenna at all, unless you connect the tuner as close
to the antenna as you physically can.

Hope this helps -

Dennis - N8BMB

From: J
Topic: 30431 Message: 30431

Hi Guys,

I am looking for a FT-897D that is clean/looks new and if possible no mods but not a deal breaker. My email is; k_b_3_k_w_j_@_y_a_h_o_o.c_o_m
Without the "_"

Thank you and take care,

John KB3KWJ

> the best ones.

Please read the Original post; the MFJ meter in question IS a peak reading meter!

Now of course it is possible that the meter was not powered up during the measurements or it is faulty.

I do really wish that people would read what was posted rather than jumping in with stock answers about Average Power when it is likely that the real answer lies eleswhere.

The OP has posted this problem before and just got mainly the same torrent of unhelpful 'average power' answers, and no real explaination of what is actually going on.

His readings on 40m for FM and AM seem perfectly correct, and the meter is obviously working in Peak mode because the well documented overshoot on AM is seen before the carrier drops back to the correct level.

What has not been answered is why there is an initial overshoot on ssb to 100W and then subsequent peaks only reach 35-40W, even with high mic gain settings and a processor in line.

30433. 897 Internal meter vs SWR bridge

Yahoo group: FT897 (2010)
Date: 2010-06-28 00:13:40 UTC
From: iceberg iceberg
Topic: 30433 Message: 30433

Is the internal meter on the 897 accurate enough for common use (with the FTL meter attached) or would a full SWR/Watt meter be a better investment than the FTL meter?

>73
>Jeff

Well
thats cuz the overshoot is not specific to the AM mode.
the 857 and 897 are well known for their momentary overshoot in SSB. Caused
by the lag time of the ALC kicking in. There are mods available to
overcome this
so that, particuarly if the transceiver is needed for use as a transverter
driver,
the overshoot doesnt kill the input to the transverter.
here's a link to the page with the mods for the
857/897 http://www.astromag.co.uk/ft857d/

cheers
Dave

That seems unlikely as the overshoots are being observed; if the meter was in average mode they are too short to be recorded at any where near the 100W level.

On the subject of overshoots, I agree that it is visible in AM, or in other modes when a power output lower than 100W is set; but it still does not explain why, when set for 100W on ssb, there is an initial overshoot to 100W but subsequent peaks are only 30W!

Ok well hopefully the person concerned is still looking at the emails.

it really sounds like its time for the 897 to go onto a decent dummy
load power
meter and confirm exactly what is happening.

under that test condition IS the power out as it should be or is it still
low ??
its time to confirm if the MFJ tuner or some other item in the chain is at
fault or if it is the 897 that is playing up.

cheers

From: vhklein2003
Topic: 30433 Message: 30441

The internal meter is more than adequate, maybe even better than an external for practical use. You don't really need to know if the SWR is 1.56:1 vs. 1.62:1, just that it is as close to 1:1 as you can get it, as the radio sees it.

Actually it doesn't "fool" the radio. Tuners use various methods to increase or decrease the length of the antenna lead in order to reduce or "flatten" the standing wave ratio.

>I don't wish to sound mean or berating, but this is BASIC radio and >was covered in the study manual.

Yes you do.

I personally didn't study any manuals. I wrote the answers on the bottom of my flip flops and if I hadn't stepped on that piece of gum I would have aced it.

I could use suggestions on the fldigi configuration for the FT-897D.
I connect a Rigrunner USB Cat connection to the Accessory CAT port of the AT-897 tuner.

When I can get fldigi to key the radio, it stays keyed. Don't have this problem with digipan. Would prefer to use fldigi.

Any suggestions on Rig control settings etc?

Thanks,
Peter Grace AI6PG

Hi
Maybe high swr is causing the transmitter to "fold back" after the initial key up thereby saving the finals.

Just my 2.734 cents worth (Adjusted for inflation)

30447. No PTT from front port

Yahoo group: FT897 (2010)
Date: 2010-06-28 00:23:13 UTC
From: Jim
Topic: 30447 Message: 30447

Here's an interesting one. I was out at FD yesterday and the PTT on any device (MD 200, Heil headest with foot pedal, and MH31) won't key transmit on the radio. I can key transmit through VOX, CAT port via HRD, Data port via my RB P&P and a key will work.

I've looked for any setting that might resolve this,and I've also tried the hard reset (Power, F, V/M) and no joy there either. I have also looked at the pins and I don't appear to have a bent pin.

Anyone have suggestions or is it time for the shop?

Thanks,
Jim - N4BFR

Hi Travis,

Yes $850 is the going price. A ham shop has it for $880 brand new. I have an offer for a "10 out of 10" (that's what the seller states) 897 with the autotuner, one battery and one charger plus shipping for $800. I have the LDG autotuner so if I purchased the 897 I would sell the yaesu autotuner (I read that the LDG model is better).

Another gentleman has two yaesu batteries for $100 that I might take up on his offer but it depends on the age of the batteries I make up in my mind. I might be wrong but I am guessing that the batteries are the SLA type and loose charge or capacity over time. I sent him an email asking how long he has had them.

Thanks for your feedback and talk to you soon,

When I bought mine, it was a 9.9 out of 10 with batteries, LDG Tuner, Touch Tone Mic and an internal power supply for $900. This was about a month ago. I felt I got a decent deal on it. This was at a Hamfest, and there was no haggling. I had planned to purchase that exact same setup new 2 booths over, so I chalk it up to right place/right time.

Seems unlikely as the OP stated that it was into a 50ohm dummy load, and the correct 100W is shown on CW/FM.

Jim,
Is it possible you have lost the 5volts on the mike socket,this operates the TX change over on the mike,I am not sure if there is a fuse for that?

Subject: [FT897] No PTT from front port

Here's an interesting one. I was out at FD yesterday and the PTT on any device (MD 200, Heil headest with foot pedal, and MH31) won't key transmit on the radio. I can key transmit through VOX, CAT port via HRD, Data port via my RB P&P and a key will work.

I've looked for any setting that might resolve this,and I've also tried the hard reset (Power, F, V/M) and no joy there either. I have also looked at the pins and I don't appear to have a bent pin.

Anyone have suggestions or is it time for the shop?

Thanks,
Jim - N4BFR

actually it does fool the radio.
it does not change the length of anything. it acts as an adjustable impedance transformer to allow the radio to output its full power to a matched impedance antenna.
it fools the radio into seeing a matched impedance, of 50 ohms.
with matched impedance, the swr is lowered allowing the radio to output its full power the the unmatched antenna, and feed line.
the unmatched impedance of the feed line and antenna stays exactly the same, the feed line length stays exactly the same. but the radio sees a matched feed line and a matched antenna.
so it basically fools the radio.
so there
:-)

The behavior is normal.
Power meter is reading Average power.
If you want the max reading, you have to use a "peak reading" meter.
The AM power on the 897 is about a third the max power -- 25-35 watts is typical (see manual)
100 Watts is high for the FM output. Mine is 50 Watts.

I have same behaviour.
Using the MFJ-949E power meter to estimate transmition power, I get only 30 W on SSB, even I am using voice processor or increasing other parameters - MIC Gain, etc.
Any idea how to get the 100 W on SSB?

Tnx,

Duncan

So I have just joined the hobby. I got my General in May and now have an FT-897 and a G5RV Junior (1/2 length, 51 ft) Antenna. I am having a wonderful time and am happy to have found the group here. I was very pleased to find the thread with the reference about how to connect TWO CAT systems to the radio. I am have a few other questions about the radio:

1) If I have the FC-30 Antenna Tuner, can I also use a larger manual tuner like an MFJ-969? Can I use them together or should I just use one or the other depending on the circumstance?

2) I am currently set up with the FP-30 power supply, but would like to make the radio "grab and go" if possible. Is there a mod or a way to quickly swap the FP-30 with the normal bottom that takes 2 batteries? Can you use the PF-30 to charge the CD-24 and the batteries?

Well, that's enough for now. Cheers,

Mitch - KJ4UBX

I used a lowel lightkit stand. ~$160 new but mine were very old trash can pickups. The tripod legs can be pinned down with tent stakes. They go upto 16ft but I added 5ft of light PVC. From our experience this FD, 25ft is not tall enough for a G5RV but we were able to put up several fan dipoles for 10/15/20/40m (http://www.hamuniverse.com/multidipole.html) with great success.

Well, it has a pretty decent but not excelant score on eham:
http://www.eham.net/reviews/detail/6876

Just remember this thing is going to hang 12 feet out of your window. Make sure you have the clearance and there are now power lines or cables it will interfere with or that will interfere with it. Reading the reviews on eham would be a good idea to see what complications others have run into that kept it from getting a higher score. See if those complications are things you are ok with.

DE N7UVL,
My opinion: Leave the FP-30 in place. Full power will
always be available. Even when the FP-30 is disconnected
on the back and a 13.8VDC external supply is connected,
the higher power aspect will still be available if necessary.
-Connecting the internal batteries interrupt that selection/
option.
-Having the internal batteries for an FT-897 are nice for
constant portable & QRP operation. But consider the choices./ga

I went to target or a similar type store (I honestly dont recall now) and got a cheap camera tripod. I then got a flat mounting plate for a bolt on antenna (CB iirc) and drilled the hole a bit bigger to accomodate a NMO style 259 adapter. I attached 5 sets of radials onto the plate with wingnuts (originally trying cookie sheets and similar things which did not work out well). I attach an ATAS-120 onto that (although I would recommend other similar style antennas instead, there are some bands the ATAS does not do). This works well, and is a similar design to the above url.

I started with http://aa5fr.com/atas120a.htm as a base for the idea (end of the page). I am pleased with my inexpensive tripod, and I get enough height if I desire it, although the radials work better when its lower to the ground.

The FC-30 antenna tuner by Yaesu only tunes an antenna if it is within 3:1 SWR limits. Many of the frequencies covered by the G5RV have swr levels beyond the Fc-30's capabilities. As a result, the tuner won't tune some of the bands and eventually it gets damaged.
There are other automatic tuners available that will tune up a wet piece of Spagetti. But then wet spagetti doesn't radiate too well.
Try and use antennas that are close to resonance for best results.
Use one tuner OR the other but not both at the same time.

30471. SSB TX Audio Problem on 6 meters

Yahoo group: FT897 (2010)
Date: 2010-07-03 02:27:50 UTC
From: jerryjohnston
Topic: 30471 Message: 30471

I've got an approximately 6 year old FT-897. Tonight I was working 6 meters SSB and two different contacts mentioned I had poor audio that seemed to be cutting in and out. I listened to my on-air transmission via another radio and there was distortion and what seemed to be "pulsating" for lack of a better description. 15 and 10 meters showed this problem to a lesser degree. This only happens on LSB/USB, and not on 20 or 40 meters.

I did notice that if I didn't use the LDG AT-897 tuner first, the problem seemed to "sync" with the HSWR indicator on the display.

I tried running on battery to rule out the power supply, same thing. Also adjusting my mic gain had no effect (I'm using the standard MH-31 mic). Since I don't work above 20 meters much, I don't know how long this problem has been occurring.

A Google search turned up this:
http://members.cox.net/w1aex/897idle.html

Has anyone else had this problem and found a fix, or can recommend the above fix?

30472. RE: [FT897] SSB TX Audio Problem on 6 meters

From: Joseph Richard
Topic: 30471 Message: 30472

Sounds like you are having RFI issues. The LDG antenna tuner is not very good at 6m. If you make some power measurements in by-pass, you will roughly see anywhere from a 1.5:1 to 2.1:1 VSWR into a 50-ohm load. They may have improved the AT897 Plus model.

30475. Rig thinks it's on battery power

Yahoo group: FT897 (2010)
Date: 2010-07-02 18:47:04 UTC
From: Scott
Topic: 30475 Message: 30475

Afternoon to the group!

Last week I acquired an FT-857 (non-D), with DSP installed. On the supplied power cable (which has two positive, to negative leads on the rig-end, continuity confirmed) hooked up to a 13.8W VDC bench supply, the rig puts out 20 watts, regardless of the power being set to 100W. What's odd, is that the battery icon next to the voltage on the display is on, although I've confirmed there are no internal batteries installed. For the life of me I can't find a menu setting to specify if it has batteries installed, the A/B switch on top makes no effect, and all references I see say that it operates on 20W "automatically." I've also done a processor/factory reset.

One of my thoughts is maybe there's a short somewhere from someone hooking up a battery improperly, but I hadn't found a schematic for the rig yet and started tracing the circuits out. Any ideas, or am I hopefully putting too much thought in to a simple procedure?

73,
Scott, N5KRC

Be very carefull! I did this alignment thinking it was my problem when in fact it was the DSP ground issue and the biases were all fine for the serial number of my rig. Luckly, I wrote down all the voltages before and also marked the pots with whiteout and I was able to return my radio to it's proper setting.

I guess what I'm saying is to make sure your radio is of the right SN and construction for the bias settings on that web page.

Hi

Before you go changing bias settings be aware that the PA devices have changed at least once and may be more, and the different devices require different bias settings. Make sure that you have the correct values for your particular set!!

Subject: [FT897] SSB TX Audio Problem on 6 meters

I've got an approximately 6 year old FT-897. Tonight I was working 6 meters SSB and two different contacts mentioned I had poor audio that seemed to be cutting in and out. I listened to my on-air transmission via another radio and there was distortion and what seemed to be "pulsating" for lack of a better description. 15 and 10 meters showed this problem to a lesser degree. This only happens on LSB/USB, and not on 20 or 40 meters.

I did notice that if I didn't use the LDG AT-897 tuner first, the problem seemed to "sync" with the HSWR indicator on the display.

I tried running on battery to rule out the power supply, same thing. Also adjusting my mic gain had no effect (I'm using the standard MH-31 mic). Since I don't work above 20 meters much, I don't know how long this problem has been occurring.

A Google search turned up this:
http://members.cox.net/w1aex/897idle.html

Has anyone else had this problem and found a fix, or can recommend the above fix?

From: kb1dni
Topic: 30478 Message: 30478

Hello:
I was trying to find a document or instructions for using Softjump. The one listed in the "files" section is for Win 98 and I believe it dates back to 2003.

I just want to confirm how to use softjump and what the new "expanded" setting will be using Softjump.

Thanks for the assistance.

IIRC, Soft jump only works on FT-897D that were manufactured at that time.
Seems the FCC didn't like Yaesu allowing people to fire up windows and open
up a radio by anyone.

30480. Re: Power out

Yahoo group: FT897 (2010)
Date: 2010-07-04 20:02:57 UTC
From: Bernie
Topic: 30278 Message: 30480

After having played, studied, and built many antennas, I have yet been able to find a way to either shorten or lengthen an antenna lead short of either lopping off some of it with a loping shears or tying one end to a fence post and the other end to a car bumper and pulling. All an antenna tuner, more properly antenna matcher, does is adjust what the tranceiver sees to fit it's proper operating requirements. The length of the antenna feed is actually not a problem, it is whether the antenna is at proper resonance at the frequency that you are trying to transmit on. The antenna matcher adjusts for that so that the tranceiver "does see" what it needs to transmit properly. In other words it does fool the tranceiver so that it can transmit. If you have your antenna adjusted to the proper length for a specific frequency, you can use a 25 foot antenna lead or a 250 antenna lead, and it will still be the same except for loss in the line because of the length. And with that properly adjusted antenna the need for the antenna matcher is not there.

Jerry,

Jeff's cautions are well advised. Not all 897's are the same! With that in mind, you say yours is 6 years old, which makes it from the same vintage as my own, which was manufactured in June of 2004 and has a serial number in this category: 4H370xxx

The gritty-distorted-audio issue with my rig started out on 6 meters, and then began to show up on the higher frequency HF bands. The severity of the symptoms also appeared to vary from day to day. It was also sensitive to changes in SWR as the ALC intervened to reduce output power.

It was easy to confirm that this was not an RF feedback issue by monitoring the rig while it dumped power into a dummy load. Another way to check is to solicit a report while running FM in the 10 meter or 6 meter FM regions. If it's clean on FM but sounds nasty on sideband, be suspicious that the final devices are not biased correctly for linear operation.

As it turned out, my unit was very poorly adjusted, with several stages idling close to cut-off. Once it was set to the factory specs it behaved beautifully on all bands. When I checked the settings a year later, they had wandered, but were nowhere close to cut-off. It's not a big deal to check the settings and correct them to the values recommended in the service manual that applies to your rig's serial number.

You may also wish to read my comments on the FC-30 ATU I left on eHam some time ago when I first had my FT-897. Sounds like you are going through the same sort of exercises.

I sold my FC-30 off because it just didn't do the job. Somebody was happy to have it. I tend to use a manual tuner now.

Scott,

You may have a grounding short on the power cable or power connector to one of the bottom sensing pins - the 857 has a 20W "switch" setting if the bottom left power connection is grounded. Could be the same on the 897 ? Could even be a solder whisker. Info from DJ3NRA on mods.dk

Good luck & 73

> Last week I acquired an FT-857 (non-D), with DSP installed. On the supplied power cable (which has two positive, to negative leads on the rig-end, continuity confirmed) hooked up to a 13.8W VDC bench supply, the rig puts out 20 watts, regardless of the power being set to 100W. What's odd, is that the battery icon next to the voltage on the display is on, although I've confirmed there are no internal batteries installed. For the life of me I can't find a menu setting to specify if it has batteries installed, the A/B switch on top makes no effect, and all references I see say that it operates on 20W "automatically." I've also done a processor/factory reset.
>
> One of my thoughts is maybe there's a short somewhere from someone hooking up a battery improperly, but I hadn't found a schematic for the rig yet and started tracing the circuits out. Any ideas, or am I hopefully putting too much thought in to a simple procedure?

Villas . . .

The Digital Notch Filter on the 897 has been pretty worthless from day one. Note that the brochures and manual have always stated that the notch filter helps to "reduce" heterodynes, not eliminate them.

I'm on my second 897 and have always used either an NIR-12 or a Clear Speech when I needed to.

Again, keep in mind it's only an $800 radio, it wasn't intended to be your main rig, and it certainly wasn't designed as a contest radio.

It is what it is -- a very adequate portable rig, reasonably priced, that does an awful lot of things passably well but not superbly well, and provides features in one box that no other manufacturer has chosen to compete with.

It's also an excellent beginner's radio that can be useful throughout a ham's life.

Ok Kent, but I put my IC-718 in the same frequency and it kill all the heterodynes but my 897D not (IC-718 DSP and 897D DSP is a audio DSP). Why ? the 897D is a better radio tham 718 but DSP notch filter... I´ll like to use all time my 897D but whem have heterodynes in frequency I need use my IC-718.

From: harry latterman
Topic: 30483 Message: 30487

My 2 cents work..At this time I have a 897D, IC-7200 and IC-756. In the past I have owned and traded a IC-718, 703, 706 and a few others. ICOM appears to have better math and better hardware when in comes to DNF. The 7200 uses IF-DSP and really is in a PROIII/7600 class when it comes to noise reduction, signal separtaion and digging out signals. It is only a couple hundred more then the 897D and is light years better. The 718 is audio DSP like the one in the 703 and 706 and my expereince is far better then the 897D.

My 897D is my do it all, take it with your radio. It has the internal PS and so far the 2.3khz inrad filer (CW soon). It gives me HF-UHF in a nice package. I have worked a lot of DX with it. But when it comes to serious DX and serious QRM/QRN noise reduction I go to the IC-7200 or my old classic IC-756. I know Yeasu can do a really good DSP. I have had the FT-450 which uses an IF-DSP. It did a very good job. But in a side by side comparison, using a A/B antenna switch ICOM did a better job.

If you really have a noise problem borrow a ICOM 7200, 7000, PRO or even a FT-450 and check it out for yourself with the 897 in a A/B switch. Or get an external DSP using new algrithms.

Hope my experiences have been helpful.

Your 897's hidden service menu factory settings are unique and should not be adjusted without a well equipped test bench. What leads you to believe that your settings are incorrect?

Thanks for your comments... After researching the serial number (2M080XXX), I find it is older than I originally thought (I purchased it used off eBay). According to the s/n, it was manufactured in November 2002.

The service manual does not seem to differentiate between dates of manufacture, at least as far as the alignment adjustments for SSB are concerned.

I was on 20 meters over the weekend and asked for an audio report. The ham at the other end said that there was no cutting in and out as on 6 meters, but that my audio sounded "tinny" as if I were speaking into a tin cup. I am using the MH-31 mic that came with the rig, with the setting on the back side to "2", which is supposed to introduce more bass into the mic. I don't know if this is normal for the basic MH-31 mic, or if another problem with the rig exists.

At this point I'm wondering if I should attempt the bias adjustments or send in the rig for re-alignment, though I'm not sure where to send it.

From: Daniel
Topic: 30493 Message: 30493

My 897d is getting an intermittant audio output on all hf bands. Started developing this problem after about a year now getting worse. Audio goes in an out at different levels. Very annoying. I have no sophisticated test instrumnets. Any suggestions as to how I should tackle this problem? I am sure that I could change out a board; May be better to have someone take a look at it? Has anyone had this problem?

Any advice would be helpful.
Dan

But a transformer does transform either mechanically or electrically so it's not fooling the radio. If this were true antenna manufacturers wouldn't have to worry about little things such as forward power and radiated patterns. They could just come out with the Co-At Hang'r series of antennas. No need for band taps or wound coils since we're fooling the radio anyway. And while we're at it we can just use the wire we used on the boat trailer lights for antenna lead. After all we're just fooling the radio.

> The service manual does not seem to differentiate between manufacture dates,
> so how would I determine which bias settings to use?
> My rig was manufactured in November of 2002.

Actually, it does. The first 2 digits after the year/month code on
the serial number gives the lot code and yes, there are different
settings for different lots.

Current revision of the service manual is Rev C.
If the info you have doesn't have this, chances are the manual you have
is Rev A (also often found on the Internet).
Rev A is really obsolete now; you can tell because it doesn't show
any lot# information.

Yaesu sells service manuals for ~ 10EUR.

Hi Chris;

The real filtering for best results in noise suppression has to happen in the IF level before the demodulation.

If you want to have the cleanest audio possible you should check ou tour site:

http://users.skynet.be/myspace/mdsr

I recommend this to anyone.....

Hi Alex

You are correct with one exception. The best CW filter is a sharp Crystal or Mechanical Filter. The "heard" signal strength seems to improve when the filter is on.
DSP can't do that. IF or AF DSP.
I have been comparing my FT-2000 with my FT-897D and FT-920 and in terms of pulling out the weak CW signal, the optional filter does it better than the DSP.

30502. After tuning in high power, LDG AT-897 tuner seems to fail.

Yahoo group: FT897 (2010)
Date: 2010-07-08 17:49:10 UTC
From: klokkenman
Topic: 30502 Message: 30502

After getting donated a defect AT-897 tuner, I looked into the device to try to solve the problem.
At first I thought something must be wrong with one of the L-C circuits because of a too high HF input during tuning. After a little understanding of the operation, and trying the tuner in the stand-by mode connected to a dummy load. The outcome was a high SWR. Some measurements later the first relay K8 seems to be closed for bypass and operation at the same time.
No other components are connected parallel with these switches, so probably this relay has been melted inside. No marks at the outside what so ever.
Before I start to dismount he relay, and probably burn off some parts of the print-board, and have no understanding of how the relays are controlled, I place this story as a topic hoping that another member may give me some handouts or advice
If my conclusion is correct, I am also looking for a new relays or another defect specimen using the same relays. HFD2-009-S-L2-D(555)

> Thx Bart
>

The way I remember it is, the meter is proportional to the percentage "p" of reflected voltage (like most SWR meters). Then, it's VSWR = (1+p)/(1-p)
**
So, half scale is 3:1, quarter scale is 1.6, 1/5 scale is 1.5, and so on.

I've always thought that SWR really needs to be understood (or worried about) in terms of percentage of reflected power anyway, so why compute VSWR and then compute back? 50% (half scale) is 25% reflected power; 25% (quarter scale) is 6.25% reflected power; 20% (1/5 scale) is 4% reflected power, and so on (express the percentage as a fraction and then square it). I would think that anything under 10% reflected power for solid state devices is OK, and anything under 5% is great. Forget the @#$%* SWR number !!!

The only reason I can think of to think in terms of SWR is when talking to someone else who speaks SWR, or when reading spec. sheets.

From: jerryjohnston
Topic: 30471 Message: 30506

Hi Rob,

I performed the alignment per your page at http://members.cox.net/w1aex/897idle.html - but am still having problem at high power (100w). Alignment was performed at 5 watts as I have only a small dummy load.

After noting the existing value for each step, I aligned to bring to the Yaesu specs or slightly above after reading that's how you set your rig. I did this while running 5 watts into a dummy load. The exciter stage idling current was at 180 ma (combined) and after setting them at 108/216 that step seemed to make the most difference when I listened on-air after each step (step 1 pre-driver and driver bias had no effect). I went ahead and did the power amplifier step also.

After completing, I noticed two things:

1) Power reading on my LDG meter (plugged into bottom of FT-897) shows a max power of around 30-35 watts, even when rig is set at 100 watts. If rig is set at 10 watts, LDG meter reads 10 watts but as I increase power it seems to max out about 30-35 watts.

2) When listening to my signal on-air, while everything sounds great at 5-10 watts but as I increase power the audio gets worse and starts cutting out as before.

So, should the alignment have been done at full power 100W? If so, what alignment steps do I need to repeat (hopefully not step 1 as soldering to the test pads was difficult). Also, if I align at 100W will audio still be okay at lower power as well?

Sorry for all the questions...

> Jeff's cautions are well advised. Not all 897's are the same! With that in mind, you say yours is 6 years old, which makes it from the same vintage as my own, which was manufactured in June of 2004 and has a serial number in this category: 4H370xxx
>
> The gritty-distorted-audio issue with my rig started out on 6 meters, and then began to show up on the higher frequency HF bands. The severity of the symptoms also appeared to vary from day to day. It was also sensitive to changes in SWR as the ALC intervened to reduce output power.
>
> It was easy to confirm that this was not an RF feedback issue by monitoring the rig while it dumped power into a dummy load. Another way to check is to solicit a report while running FM in the 10 meter or 6 meter FM regions. If it's clean on FM but sounds nasty on sideband, be suspicious that the final devices are not biased correctly for linear operation.
>

> As it turned out, my unit was very poorly adjusted, with several stages idling close to cut-off. Once it was set to the factory specs it behaved beautifully on all bands. When I checked the settings a year later, they had wandered, but were nowhere close to cut-off. It's not a big deal to check the settings and correct them to the values recommended in the service manual that applies to your rig's serial number.

Thnx Jay.
Being dutch makes it a bit difficult for me speaking with one of their technicians. Especially the technical part. I did send a mail instead.
They responded within two hours, and without any further conversation they are sending me a couple of relays with no charge. Not even for the shipping. The most amazing service I've ever seen.
So I think they agreed with my conclusion.

30509. SIGNALINK on FT-897

Yahoo group: FT897 (2010)
Date: 2010-07-09 14:01:35 UTC
From: Danny Loyd
Topic: 30509 Message: 30509

I have already looked at the files on this group for the answer to this question and was unable to find it. So here is the question, I just recently ordered and received a SIGNALINK USB and have done the pin-out on JP-1 as instructed by the manual. When I plug the SIGNALINK into the FT-897, even with no power on the SIGNALINK or even plugged to the computer, the radio starts acting like it is keying and unkeying constantly and when I unplug the cable from the data port it stops. I have checked the pin-out against the 897 manual and everything looks good.

My question is, has anyone else had this problem with the SIGNALINK and what did you do to correct it?

Thanks in advance for the advise,

Danny

Danny,

No, we have not had any problems w/Signalink hooked up to the rig, matter of fact, I'm using it right now to hook up to winmor.
It's been a while, but if I recall correctly, there where at least two jumpers that we had to install.

I can look it up again sometime soon. We just redid the shack; no HF for two days...withdrawals!!!
Still in a bit of disarray state here.

Cheers,

Topic: 30509 Message: 30515

It works beautifully for me.

There are at least two different pin-outs given by SignaLink for the FT-897 -- one if you're connecting via the RJ-45 Mic Connector and the other if you're connecting via the 6-pin Mini DIN Data Port Connector in the back of the radio. Make sure that you're using the right one.

Also, make sure that the pin-out you're using specifically says that it is for the FT-897.

30516. True RF power output on FT 897D?

Yahoo group: FT897 (2010)
Date: 2010-07-10 17:14:07 UTC
From: stereoimage73
Topic: 30516 Message: 30516

Just got my ticket and purchased the FT 897D new. Also got the LDG FT Meter for the 897 D (plugs in to the radio) so I can check SWR and and other parameters.

I am using with an MFJ 1625 balcony antenna. Getting a 1.2 to 1 match on 20 meters. When I transmit (and referencing power output on meter) Im only seeing max 50 watts output with the radio set at 100 watts.

I thought the

I believe the radio will put out a MAXIMUM of 100 watts but the average will be a bit less than that.

Question:

a.The big question. Does the meter represent the real radio output or is the output of the radio affected with an antenna/tuner load?.

b. Will SSB power output or metering differ from AM/CW/FM modes?

Since the LDG meter never shows more than 50 watt peaks (and its a new radio) I'm not sure what what referencing.

Thanks for any opinions. I'm new to this and want to get as much information as possible. I would have called Yaesu but they are closed on Saturday.

Regards
Mark

From: W1AEX
Topic: 30471 Message: 30517

Hi Jerry,

Since you are only adjusting the idling current, it makes no difference what the power is set to during the procedure, and these adjustments will have no affect on the output power when drive is applied afterward. If you are not seeing full power output from the rig, and distortion is occurring as you attempt to operate at high power, it's possible that one of the output transistors has failed, or more likely, one of the driver or exciter FETs. I think you mentioned that your 897D was from a 2002 production run, which might be old enough to be using 2SK2973 devices in the driver stage, and 2SK2975 devices in the exciter stage. I'm afraid they are quite famous for failing. If one of those has failed, it will produce the symptoms you are seeing, with low output, and distortion. I'm sure that's not what you wanted to hear.

I agree that the little solder pads are pretty annoying, but it would be worth going through the procedure again, just to double check all the settings. Again, it makes no difference what the power is set to, since no RF drive is being applied during the adjustment steps. If all the numbers look to be in the ballpark, and you are still having issues at higher power, it's likely a device in one of the TX power stages has failed.

Good luck!

Rob W1AEX

30518. Re: [FT897] True RF power output on FT 897D?

Yahoo group: FT897 (2010)

From: Carl Wulfestieg
Topic: 30516 Message: 30518

Mark-
A) Yes, real radio output. When the radio "sees" a 50 Ohm load (i.e. the antenna is "tuned"), it puts out the maximum you have set.
B) Yes, the meter reading will be different, depending what mode you are using. Perhaps you should go back and review the difference between an average reading meter and a peak reading meter. An average reading meter will read about half of your power output setting on SSB. The other modes will read closer to your actual power setting.
Good Luck! You've got a great radio! I bet you'll find, like I did, that the LDG Meter is the best $50 you ever spent.

Sounds a bit strange?? If you have read and adhered to the instructions carefully and all the settings are right, it should not behave like that. It is advisable to connect the cables when all equipment is unpowered. I suppose you have some wrong setting somewhere or JP-1 has a loose contact?

I had a similar issue with my FT-100D. Ended up being a ground loop,
more of a lack of a ground
path between the Radio and the computer. Try an alligator clip from the
ground of the radio to
a chassis ground on the computer (case screw) and see if it behaves. I
had really bad AC hum,
and tx chatter until I added the ground, then dead silent.

Your 897 is probably OK. The meter is indicating average power output.
The 100W rating is for PEP or peak power. Typically, on SSB, average
power is 1/3 +/- of peak power, depending on the characteristics of
your voice.

> b. Will SSB power output or metering differ from AM/CW/FM modes?

The metering isn't different, but for CW and FM, average power is
peak power due to the nature of the signal. AM is more complicated.

> Since the LDG meter never shows more than 50 watt peaks (and its a new radio) I'm not sure what what referencing.

Try whistling into the mic. A whistle should produce something
approximating a pure tone, and for a pure tone, average power is
peak power, so you should see something close to 100W output.

Your other alternative is to pick up an external peak-reading
wattmeter.

Enjoy your 897!

Rob / KD8WK

You set the tone frequency but it appears you didn't activate the tone. Multi Function row "e" select TON. It's in the manual on page 34.

Hi Dan!

Might I recommend you consider purchasing a Nifty Mini Manual from Nifty! Ham Accessories.

Their URL is www.niftyaccessories.com

This Nifty manual is small and has many features, One feature that is nice for new radio owners, is the pages are plastic covered so one can make notes with out damaging the page itself.....They are quite reasonable. I have one for every radio I own.

To answer your questions:
1. [V/M]+ power on, resets all memories and following menu settings: 06, 33, 52, 56, 76, 82, and 83.
[F] + power on, Resets all menu settings except the following menu items: 06, 33, 52, 56, 76, 82, and 83.
[HOME] + power on, is the Master reset for the whole radio, memories and menu settings.
These setting can be found on page 65 of the FT897D printed manual

2. Menu 75 is the HF power set, adjusts 0 to 100 watts out. This can be found on page 61 of the printed manual.

Denny, Item 75 I believe in the menu will let you set the rf output for your current mode so if ur in SSB HF you can dial anything from 5 to 100 hold the function key for 1 or 2 seconds (beep) and it's set

I can't seem to find 2 items in the manual for my FT-897D:

1) Is there any way to delete all stored memories (clear the memory)?

2) Is there any way to lower the transmit power on SSB HF to 50 watts?

Any help in finding these answers would be greatly appreciated.

Thank you, Denny Dollahon, KJ6CFI.

30541. Using an MFJ-336S Mag Mount w/ ATAS120 antenna

Yahoo group: FT897 (2010)
Date: 2010-07-11 19:57:40 UTC
From: Joe
Topic: 30541 Message: 30541

What issues can I expect to encounter using a MFJ-336S mag mount on my pickup truck with the ATAS-120 screwdriver antenna? The mag mount is the big, heavy duty, 2 magnet job. I have already put it on my truck and tested it at 80 mph...no movement of the mount occurred, so *that* in not an issue.

I am concerned about proper grounding of the antenna as well as other, unknown factors, which, I hope, you learned people can edjumacate me about!

I will be using this antenna with my FT-857D.

Thanks in advance!

Mike,

Sounds like you are transmitting in on repeater OUTPUT frequency, not the repeater INPUT Frequency

(1) Make sure that in the Multi Function Subdirectory subdirectory, you do:

(a) Multi-Function Row (a) subdirectory VFO A/B; it displays VFOa;
(b) Mullti-Function Row (d) subdirectory make sure you do not have "REV" depressed...[REV]...that will cause your radio to transmit on the OUTPUT frequency.
(c) Multi-Function Row (d) subdirectory, make sure that in the TON / TDCH Directory that the + TEN is activated on the top left of your screen.
(See pages 14 thru 17) in the manual)

That sounds like what might be happening.

Hope this helps,
Dick, W3GNQ

From: Clark
Topic: 30541 Message: 30546

Hi Joe -

Excellent! I, too, mount my antenna on top of my car roof with magnet mounts. I found that I could run a 15 inch piece of teflon coated hookup wire from the mount to a screw on the car radio antenna mount to get a nice firm, close ground. I run the coax over the back window with a small ferrite to keep RF on the outside of the cabin. I also use two strings as guys (I run a small bugcatcher and the string/guys - a pair - are attached at the base of the coil and run down to my side door mirrors for stability.) I am very, very careful about parking garages and the like, I'm sure I'd lose the whole thing if I didn't fold it down or take it off (I use a quick disconnect that makes it fairly easy.)

The real advantage appears to be the height above ground, the base of the antenna is right up on top of the car. I get very consistent reports that are good or better than the other mobiles running similar power near to me on the road. I am very happy with the installation.

Best of luck!

Clark

I had a similar issue with my FT-100D. Ended up being a ground loop,
more of a lack of a ground
path between the Radio and the computer. Try an alligator clip from the
ground of the radio to
a chassis ground on the computer (case screw) and see if it behaves. I

had really bad AC hum,
and tx chatter until I added the ground, then dead silent.

Thanks to everyone for your quick responses. As I responded earlier, I either had a jumper wrong or there was static electricity. I completely removed all jumpers and reinstalled and measured for ground on the SignaLink and it has worked like a charm ever since. Have contacts with Spain, New Zealand, England, Cuba and Mexico in my logs since fixing the problem late Friday night.

30550. Re: [FT897] True RF power output on FT 897D?

Yahoo group: FT897 (2010)
Date: 2010-07-12 00:51:51 UTC
From: Danny Loyd
Topic: 30516 Message: 30550

Mark,

The LDG meter is only reading the average peak reading on SSB because it shows only the delay not the total peak power that you see on other modes such as AM/CW/FM. With those modes you have full power to the carrier and it shows max peak power on the meter.

Subject: [FT897] True RF power output on FT 897D?

Just got my ticket and purchased the FT 897D new. Also got the LDG FT Meter for the 897 D (plugs in to the radio) so I can check SWR and and other parameters.

I am using with an MFJ 1625 balcony antenna. Getting a 1.2 to 1 match on 20 meters. When I transmit (and referencing power output on meter) Im only seeing max 50 watts output with the radio set at 100 watts.

I thought the

I believe the radio will put out a MAXIMUM of 100 watts but the average will be a bit less than that.

Question:

a.The big question. Does the meter represent the real radio output or is the output of the radio affected with an antenna/tuner load?.

b. Will SSB power output or metering differ from AM/CW/FM modes?

Since the LDG meter never shows more than 50 watt peaks (and its a new radio) I'm not sure what what referencing.

Thanks for any opinions. I'm new to this and want to get as much information as possible. I would have called Yaesu but they are closed on Saturday.

Regards
Mark

Yahoo group: FT897 (2010)
Date: 2010-07-12 03:32:38 UTC
From: Scott Chrestman
Topic: 30475 Message: 30553

Had some time this weekend to look more in to this...

No "brown wire" on the 897. When I tore the rig down on the bench, I noted that on the internal power connector, only the two positive and negative leads are hooked up to the power input on the circuit board. I disconnected one set of both positive and negative leads, and then the others, with no change in battery detection.

I went in to the battery bay, removed the internal shield, and disconnected both battery inputs from the main board. This completely isolated the battery circuits (which I assume the battery sense circuit is), and it still powered up indicating it was on battery power. I've also disconnected the A/B battery rocker switch from the main board. I preformed a factory reset after powering back up with both the battery leads and rocker switch unplugged.

Here's something interesting I noticed... When I hold down the power button the battery indicator goes off. As we know, when you hold the power button for 3-5 seconds, the rig will turn off. However, during that 3-5 seconds, with the battery indicator off, I have no problems getting 100W output in to a dummyload. At least I know the finals are good and that's not the issue....

sigh

I disconnected one set of both positive and negative leads, and then the others, with no change in battery detection.

I went in to the battery bay, removed the internal shield, and disconnected both battery inputs from the main board. This completely isolated the battery circuits (which I assume the battery sense circuit is), and it still powered up indicating it was on battery power. I've also disconnected the A/B battery rocker switch from the main board. I preformed a factory reset after powering back up with both the battery leads and rocker switch unplugged.

Here's something interesting I noticed... When I hold down the power button the battery indicator goes off. As we know, when you hold the power button for 3-5 seconds, the rig will turn off. However, during that 3-5 seconds, with the battery indicator off, I have no problems getting 100W output in to a dummyload. At least I know the finals are good and that's not the issue....

sigh

Actually Danny, no I didn't... I was specifically targeting the items directly related to the battery -- The A/B switch, and the battery power connectors. I'll give the board a good look this evening. I did notice yesterday that it will transmit out-of-band, even after a hard reset, so there has obviously been an iron on the board at some point. Thanks for pointing out the obvious! :)

Mint FT897D
Non smoking op
With manual and mic.
~5 hrs use. It is my back up rig and has just been sitting on my operating bench.

Need to thin the herd to buy a VL1000 amp.

$725.00 plus shipping from 06401

30559. Excessive RX noise. Noise dip after short transmissions.

Yahoo group: FT897 (2010)
Date: 2010-07-13 01:55:01 UTC
From: kj4nts
Topic: 30559 Message: 30559

I began my ham career 11 months ago when I got my ticket and bought an 897D. Since then I have endured continual background noise in the S8-S9 range on 20-80 meters. Having no other experience with radios, I assumed this was normal background noise. This past weekend an experienced ham used my radio and was shocked by the noise level. He said S0-S2 is normal. I live 1/3 mile from the nearest neigbor and 1/2 mile from the nearest pole-mounted transformer.

The other ham and I spent 4 hours today researching the noise problem and observed this:

We performed the test with pre-amp off, attenuation off, DSP off, and RF gain set to max (full clockwise).

The noise has a rushing, hiss sound like atmospheric noise except it runs around S8 on an idle 20 meter frequency.

There are breaks in the noise that last from 15 seconds to 20 minutes. There doesn't appear to be any pattern to the breaks. During the breaks the noise level is S0 with brief bursts up to S1.

Turning off all electrical equipment in my house and running the radio on batteries does not affect the noise.

I have a LDG AT-897 antenna tuner. If I trigger a tune cycle an interesting thing happens at the end of the tune cycle:

1. For 1 second the noise level jumps up to S8.
2. The noise level then drops to S0 and stays there for 3-4 seconds.
3. The noise level returns to S8 and stays there.

This behavior is 90% reproducable, but sometimes it doesn't happen.

I can cause the same noise level dip to occur most of the time by transmitting a short sound (callsign only) on SSB. However, if I transmit for more than a few seconds before releasing PTT, the dip does not occur.

We wondered if the 3-4 second noise dip was due to the radio going into some recovery mode like AGC that would cause it to drop all RF gain. We tested this by finding a weak signal barely audible above the noise. Then we triggered an antenna tune cycle and listened to the station during the 3-4 second noise dip. The station signal came in clearly until the end of the noise dip when it was swallowed by the noise.

I contacted another ham in town who also has an 897 with AT-897 tuner, described my problem, and asked him what noise floor is normal for him. He replied that he thought S8 was a normal noise floor for 20 meters due to the urban setting. A third ham who has an Icom 7000 and lives in the general area reports a noise floor of S1.

So I'm now beginning to think the noise problem is not coming from some external source like a power line but rather is coming from within the radio. My senior ham friend agrees

with this.

Are other hams with the 897D also experiencing S8 noise on 20 meters routinely? Has anyone else noticed the 3-4 second noise dip following an antenna tuner cycle?

I run two FT-897D. One I bought used and one bought new. They both do the very thing you describe.

I too thought it was a phenomenon of transient RF in the area at the QTH but that also proved not to be so as I experience it here in Iraq QRV as YI9VDW.

I also thought it was just limited to using an LDG AT-897, but not true. It also does it with an LDG AT-1000PRO as well.

I'll keep a close eye on the thread because inquiring minds would like to know what this is...

Phil (I assume that□s your name from your email)

I do not see anything like that noise level on 20 meters (or any of the bands ALL the time). However, the FT-897 has a notoriously hot receiver. If the noise is being generated within the radio, the following should certainly verify it.

1. Disconnect the antenna
2. Noise present? Originating within the radio
3. Noise gone. Coming in the antenna.

When I have high noise levels (I live in a townhouse and have many immediate neighbors) I reduce the RF gain and/or use the IPO function. The level dips and peaks you see could be AGC action.

One other thought comes to mind. There is a reported problem with the ceramic filters failing in these units. See earlier posts regarding the behaviors. However, the noise is reported to be more like storm-related static, i.e. lightning bursts, etc.

I believe the IPO merely takes the receiver preamp out of line so that you get an unamplified signal to your detector. It helps the receiver cope with very strong signals in its passband. Not quite the same as using an attenuator (that may leave the amp in line but lower the signal at some other point in the line).

Turning IPO off (i.e. turning pre-amp on) increases the noise level from about S7-S8 up to S9+5 (5 over).

The noise is not present with the antenna disconnected. The antenna is a G5RV at 60'.

Right now the noise level on 20 meters is S8 across the band with IPO on (pre-amp off). As occurred yesterday, following an antenna tune cycle I get
(1) 1 second of S8 noise,
(2) 3-4 seconds of S0-S1 noise,
(3) return to S8 continuous noise.
Could that be an effect of AGC which is on and set to Fast?

So far this morning I haven't seen any of the natural noise gaps that I saw yesterday. It's been solid S8 noise.

Phil,

I would try taking the tuner completely out of the mix to see what happens when you connect/disconnect the antenna. Then try it with the tuner connected and compare. This way you will know if it has anything to do with the tuner. From what you have described so far, it sounds like some sort of external QRM. Can one of your ham friends bring anther radio over to make a comparison at your QTH. I don't think results of noise from a different QTH in this case is valid.

Turning IPO off (i.e. turning pre-amp on) increases the noise level from about S7-S8 up to S9+5 (5 over).

The noise is not present with the antenna disconnected. The antenna is a G5RV at 60'.

Right now the noise level on 20 meters is S8 across the band with IPO on (pre-amp off). As occurred yesterday, following an antenna tune cycle I get
(1) 1 second of S8 noise,
(2) 3-4 seconds of S0-S1 noise,
(3) return to S8 continuous noise.
Could that be an effect of AGC which is on and set to Fast?

So far this morning I haven't seen any of the natural noise gaps that I saw yesterday. It's been solid S8 noise.

to determine if it is the tuner causing the noise, leave the tuner in line and connect a 50 resistive dummy load- activate tuner or not- simulate conditions that you think may cause the noise to happen, try with ipo off on, etc but change only 1 thing at a time
then unhook tuner and associated control cable- perform identical tests and note results- that will point to cause if any- if no or very low noise level, reconnect antenna and perform same- if upon just connecting antenna, noise instantly happens, you have a localized noise source

I believe that the IPO icon shows when the preamp is off. Confusing for us dyslexics. Think of IPO as Internal Preamp Off. I never have the internal preamp on, it makes things too noisy. With antenna connectors on rig disconnected and running on a battery your noise level should be very low. Start adding antennas until the noise appears. Make sure you are grounded at the rig. Lots of noise can come from bad or no ground.

Think of IPO as Internal Preamp Off.

Heh, heh. Actually, IPO stands for Intercept Point Optimization, a
concept used in receiver design. But, I like your acronym better --
makes more sense!

This is the worst kind of Internet trash. Please learn how to validate this stuff before you pass it on. Included is a link to one site known for confirming or debunking Internet myths. What happened on 9/11/2001 had no more to do with the true Muslim faith than the Inquisition had to do with true Christianity.

This has been around since 2009. There was no 9/11 hijacker named "Ali"; the "Imam Ali" referred to in the sign is someone who lived in the 7th century; for a full explanation, see

<http://www.snopes.com/rumors/photos/martyr.asp>

30576. Re: Excessive RX noise. Noise dip after short transmissions.

Yahoo group: FT897 (2010)
Date: 2010-07-14 00:00:09 UTC
From: Hank
Topic: 30559 Message: 30576

My 897D has behaved very similar from day one. I live in a two-story attached townhouse, and I have a dipole antenna in the attic. I went through all of the troubleshooting advice that people here are recommending, and nothing changed. 20 was the worst, but sometimes 17 was fairly quite. I was starting to think the radio was bad.

Then last year I took my radio to field day. Our site was a horse farm in the middle of the country. I plugged my 897 into an inverted V and the silence was deafening. It was so quiet that I double checked the antenna and cable. The signals were 20 over nine, and the noise level was 0. I had no problem making contacts.

After a few hours, I took my rig back home and the noise was back. I was relieved and disappointed at the same time. I have also taken the rig to a park and had the same results.

I think the problem is the receiver gain is so high that it picks up noise that other rigs don't. The IPO helps, and on stronger signals, I use the attenuator. I am curious to see what you find out with your troubleshooting.

Same here - it's just noisy. It doesn't bother me since it's not my main rig - just use it when in a cabin or traveling, but side-by-side with my other rigs it isn't easy on the ears. I like it because I can carry it along and figure that - for all it does in such a small package - that's OK. But I would be miserable if it was my main rig.

Turn off the preamp and AGC and see if its still there.

It shouldn't be. Assuming the unit is working right you're "gaining up"
on the RX side and being drowned in hash.

From: Patrice
Topic: 30581 Message: 30581

Hi ,
I have a problem in RX with my 18 months old FT897D.
Intermittent static noise only in FM or FMN mode on every bands.
All is ok when power on , but after fews minutes, static noise comes .
Of course I checked without antrenna and the problem still present.
Looks like the known TOKO 455kc filter problem, but in my case it is only in FM or FMN mode ...
Any advice would be helpful.
Thanks.

Patrice F1RVC.

30583. Software to manage memory?

Yahoo group: FT897 (2010)
Date: 2010-07-12 15:47:21 UTC
From: nhojaj
Topic: 30583 Message: 30583

Looking for Windows based software to allow me to manage the FT-897D memory via computer (upload/edit/download etc). Free would be best but willing to pay if necessary. Also wondering about any web sites that may have frequency lists (SWL, local repeaters, local interesting stations for example) that I could use as a starting point instead of reinventing the wheel. Thanks...John

Hi John,

I use FTBasicMMO. there is a small charge for it, $25 I think, but it is great. Use it for my 897, 857's & 817.

30585. Re: [FT897] Re: ft-897d no output on UHF

Yahoo group: FT897 (2010)
Date: 2010-07-14 06:14:13 UTC
From: Cosmin Marcu
Topic: 30520 Message: 30585

Maybe you should check the hidden menu values. To get there turn
transceiver off thenpress and hold the A,B,C keys; while
holding them in, press and hold in the [PWR] switch for
1/2 second to turn the tranceiver On.

Go to menu No 043 (Uhf PO Max). A value of 255 mean aprox 40W max on UHF. By
default it should be around 100-120 (meaning aprox 20W).

The same transistor(s) are used for VHF and UHF. If the VHF PO is O.K.
Check that the current drawn on UHF is about the same as VHF. If it is
check the diodes D3019 and D3022 for an OPEN also check diodes D3023 and
D3039 for shorts. If they are O.K. check the following:

Set Mode to SSB (NO CARRIER) The anode of D3019 Should go to +5
Volts when you press the PTT.

If you can☐t find these parts let me know ☐OFF LINE☐ and I☐ll send you the
PBC layout. All the parts on the top of the PCB

I second FTBasicMMO. It's easy to use and support for the program is the best in the industry. Bob, G4HFQ (The creator of FTBasicMMO) responds to e-mails quickly, and he regularly monitors the FTBasic yahoo group and personally responds to questions.

While there are free rig control programs, I haven't found any free memory management software for the FT-897D. However, for the small price, I am more than happy to pay for FTBasicMMO and support a ham.

Hello John

I cannot guess what country you are in,,,, but,,, there are several "scanner" [SWL] yahoo groups, which may be a way to find what you are looking for.

Our local club website www.ei7dar.com has direct acces to marine AIS, and Aircraft ADS-B, which would be somewhere to start.

If you send your email to info@... one of our SWL members will be glad to send you some info on your chosen bands.

Sorry, but I have left SWL'ing years ago,,, but,,, I have listened on the ADS-B,,, it was great up to date info on the Icelandic dust clouds when they were in vogue.

Our local 2M repeater www.ei7dar.com is live streaming 24/7 when there is activity in the club shack or the repeater.

From: Mark Baker
Topic: 30516 Message: 30592

Thanks Danny and all for the responses.

Last question: does the output of the unit vary with the SWR? Example at 1:1 swr peak 100watts at 2:1 peak 50 watts?

In other words does the metered output decline with a higher swr?

Thanks again.

From: Danny Loyd <ke5wdi@...>
To: FT897@yahoogroups.com
Sent: Sun, July 11, 2010 8:51:51 PM
Subject: Re: [FT897] True RF power output on FT 897D?

Mark,

The LDG meter is only reading the average peak reading on SSB because it shows only the delay not the total peak power that you see on other modes such as AM/CW/FM. With those modes you have full power to the carrier and it shows max peak power on the meter.

Sent: Sat, July 10, 2010 12:14:07 PM
Subject: [FT897] True RF power output on FT 897D?

Just got my ticket and purchased the FT 897D new. Also got the LDG FT Meter for the 897 D (plugs in to the radio) so I can check SWR and and other parameters.

I am using with an MFJ 1625 balcony antenna. Getting a 1.2 to 1 match on 20 meters. When I transmit (and referencing power output on meter) Im only seeing max 50 watts output with the radio set at 100 watts.

I thought the

I believe the radio will put out a MAXIMUM of 100 watts but the average will be a bit less than that.

Question:

a.The big question. Does the meter represent the real radio output or is the output of the radio affected with an antenna/tuner load?.

b. Will SSB power output or metering differ from AM/CW/FM modes?

Since the LDG meter never shows more than 50 watt peaks (and its a new radio) I'm not sure what what referencing.

Thanks for any opinions. I'm new to this and want to get as much information as possible. I would have called Yaesu but they are closed on Saturday.

Regards
Mark

30593. Re: Excessive RX noise. Noise dip after short transmissions.

Yahoo group: FT897 (2010)
Date: 2010-07-15 19:43:48 UTC
From: kav246
Topic: 30559 Message: 30593

Hello

I believe you say further down the thread the noise level was zero with the antenna removed?

If so this suggests you are picking up external interference.

The quickest way to check if that interference is self generated is to power your 897 from a battery (internal or external), set it to a frequency where the noise is most evident then have someone at your consumer unit kill the power to the whole house. If the noise goes away completely then you know it's something you've got plugged in.

Next, go round the house and unplug EVERYTHING then turn the mains back on. If the noise comes back then its one of three things. 1.Something that is hard wired (usually heating systems, cookers or electric showers, ie anything with a thermostat). 2. Something you forgot to unplug (go round and check again). 3. A problem on the consumer unit or supply.

Assuming (always dangerous) at this point that you now have mains power restored and the noise has NOT returned, you can start the joyus task of plugging back in all the gadgets you have scattered around the house, one at a time, to see if one of them is causing the problem. If one item brings the noise back then you've at least found your problem. Now all you've got to do is cure it!

Thats the easy solution but there could be a far more complicated outcome. What if you get as far as liiling the mains and find that the noise reduces by say 50% ?

That would suggest that it was partly caused by something in your house but that there is also something farther affield having an effect.

Now you have to find out what you've got that your neighbours have also got. If you're on an estate where all the houses were built the same it could be a burgler alarm/boiler/doorbell transformer etc. Alternatively if you're really neighbourly with the neighbours try and think what you got that they said "ooh I like that (TV/phone/router/fridge/electric toilet roll dispencer etc), I gotta get me one of them!" and if you hit on anything ask them to turn it off.

If all that fails, get yourself a portable HF RX (I used a Kenwood TH-F7E but just coz I had one) and start DFing. Don't use the 897 unless you have to. The ideal solution is that you have somebody monitor the noise back home while you go wandering. Have a link to them (uhf maybe) so that if you find a noise source you can (hopefully) have it turned off and ask the monitor if it made a difference.

If your really lucky you won't have to go that far!

A few noise sources I've found.

PC (obviously) (S2-S5ish band dependent)
The PSU for a Belkin USB hub (S3-S8)

Low voltage lighting transformer (S2-S3)
Energy efficient light bulb.....er NOT!!!!! (S8-S9)

And my favorite (especially as it was not my problem) a timer in the base of a street lamp (S9+40).

Good luck with the search

Regards

Kav.

PS. one other thing. If that G5RV is one of the "quality" that has cheap pink 300 ohm into a nasty plastic "pot" with a poor quality PL conector thrown at it from a hundred yards and little or no waterproofing they sometimes corrode and create a sort of grey mush that seems to rectify all kinds of crud into apparently valid radio signals that just sound like hash. You could try replacing those parts with better compnents.

Yes, the rig has an SWR protection circuit that reduces the RF output as the SWR increases. Mine is fairly aggressive.

30595. Adjusting for slightly off-frequency display?

Yahoo group: FT897 (2010)
Date: 2010-07-16 03:32:41 UTC
From: Philip
Topic: 30595 Message: 30595

I thought I had read this somewhere in the manual, but I don't seem to be able to find it...whenever I tune a station on USB or LSB I find that instead of e.g. 14.285 being right in frequency that I always need to tune off by about .04 So if I tune to 14.285 and listen, the voice on USB is just a little too low so I always tune to 14.284.96

Where can I make that slight adjustment to the rig? Sort of a permanent RIT adjustment I suppose. Anyway- I'd like to be able to make that change. Rig is an FT-897D if that matters.

Thanks.

30596. Re: Adjusting for slightly off-frequency display?

From: Steve Yates
Topic: 30595 Message: 30596

Hi pwscott98,

First, I would tune to 5.0 or 10.0 MHz and see how far off your rig really is from the frequency standard. You can tune to exactly 10.0 MHz and switch between USB and LSB and all should sound the same if it is on frequency. Or, you can put it in the CW mode and hole the "Home" button down to activate the tone to check the zero beat. The beat note that you hear should be no more then a few cycles per second. If your rig is off as much as you think then there will be about a 40 Hz tone generated when trying to zero beat.

If it is truly off frequency you can open the rig up and adjust the little screw on the TXCO. Or you could just set the rig up as if it were using a transverter and adjust the frequency offset in menus 089 and 090.

73,
Steve - AA5TB

Can anyone help me with the DSP function on my FT-897D? I pressed the "DSP" and got the DSP to turn on. When I pressed the DSP button again I could not get it to turn off, except to turn the radio off and fully reset the rig when powering on. I could not find anywhere in the manual how to turn on and off the DSP function. Did I miss something?

last update.

The K8 relay wasn't the problem. Comparing it with an other LDG tuner makes that clear.
One of the L-C combinations could not be switched on/ off, and replacing this relay fixed the problem.
Connected through two home made cables my tuner is now working great again.
Amazing what this little device can do.

In order to check your SWR, you can put your FT-897 in the non fixed display position. Than an green to red display will give you an indication of your SWR (if selected) no Mather what options are selected to show in your display. This will provide an instant readout of your SWR.

Despite the shortness of information, I think the services of LDG is amazing.
Trying to fix a defect LDG AT-897 tuner, LDG shipped me a couple of relays with no payment asked.
I could not claim any warranty on it. It's a second hand defect one. And it was given to me, so I could have some fun trying to repair the "magic box".
Working great now. Even it's an non plus version.

73,
Rob

Actually when you press the dsp button it pulls the dsp menu for the three keys under the display (A B C) if you have any of them turned on when you leave dsp by pressing the dsp button again it stays on the ABC keys are latch on latch off. SSo when you go back to say the meter display the dsp stays on until you return to it and unlatch the dsp function you have turned on.

Your radio will be running with 100 watts when connected to the external power supply. Good point on the battery's. I would think that they would be recharging at that time.

Hi Bob,

Sounds like you have a radio which wasn't originally meant for your region. Possibly UK where, I think, they have those restrictions. You may need to do some research, possibly in the archives of this group, to find what needs to be changed to get it correct you your region.

If it is meant for the Japanese market, there may be nothing you can do as, I believe, their units have to be fixed, in firmware of the processior, so that they cannot be changes to which end, I believe, they have a different processor chip which has the firmware hard coded and cannot be changed except by replacing the processor chip.

Topic: 30062 Message: 30619

The "AT-897" and the "AT-897 Plus" are not the same. There is a big difference. The "Plus" model is true one touch tune. You push the button, the tuner powers down the FT-897, switches it to AM mode, tunes for best match, and then returns the FT-897 back to it's original power and mode settings. As I recall the original AT-897 did not do this. You had to power down the rig yourself and switch to a constant carrier mode, and then hit the tune button, after which you had to manually return your rig back to it's original operating state. This is why I didn't buy the AT-897. Too much button pushing.

The AT-897 Plus and the YT-100 are functionally identical, except in different enclosures. The YT-100 is in a stand alone box while the AT-897 Plus bolts to the side of the rig. They do indeed take their data and power from the CAT port and there is a duplicate CAT connector on the backs of the tuners. The YT-100 tuner will also work with the Yaesu FT-857 and FT-100 rigs whereas the AT-897 Plus is a dedicated tuner for the FT-897 only.

When the YT-100 (which is the same as the AT-897 Plus except it's in a different enclosure) came out I jumped at it because of the added convenience. I'm glad I did because the YT-100 is a great little tuner.

Please note that these tuners are not true autotuners. If the SWR changes due to a change in frequency or a move to another band they do not sense a change in SWR and retune on their own. You must still monitor SWR yourself and retune when necessary. Even so with the one touch tune feature they are a big step forward in operating convenience and it's the tuner I use when I operate portable.

Hi John
The requirement to change to AM and power down to tune the 897 is truly a pain. I have one and suffered that issue for a few years until I put a tone oscillator inside the mic. All I do is push the switch on the rear and the tuner briefly chatters and all is tuned. I only run mine at 20 watts as I operate portable.

30623. FT-897 and Digital Modes On FM

Yahoo group: FT897 (2010)
Date: 2010-07-20 03:03:56 UTC
From: JonP
Topic: 30623 Message: 30623

I want to use my FT-897 to do MT63 digital over VHF FM (I'm also doing the same with an FT-7800). I'm unclear on how to make the connections. I know that I can do the hold the microphone up to the computer speaker and hold the computer microphone up to the rig's speaker trick, but I would like to do something a little more "professional" looking since I'm going to be doing demonstrations to senior people in various served agencies.

Can I use the data jack? I'm assuming that I can't because the data jack seems to be for either SSB-based digital or for FM packet. Is that correct, or can I use it? If I can, what menu settings would I use? Would I be setting the mode to FM, to Digital, or to Packet?

If not the data jack, what type of connector for the mic jack? It doesn't seem to be an RJ-45 sized jack. I have a RIGblaster NOMIC that handles a standard RJ-45 jack but I think I can rig something up if I have to.

Thanks

Jon

I believe I have the AT-897 (not the plus). It has two cables. One cable goes to the ACC jack. This is a 3.5mm stereo phone jack, and it was designed to connect to an external amp. The other cable connects to the CAT port.

The AT-897 uses the TX REQ ring of the ACC jack to drop the power and key up in CW mode. This is the signal used to tune the AT-897.

See page 18 of the FT-897 manual.

If it lacked this feature, I wouldn't be able to tune in SSB mode as I do.

So, there is no requirement to change modes with the AT-897. There is such a requirement for the Z-100, for example.

Hi John
The requirement to change to AM and power down to tune the 897 is truly a pain. I have one and suffered that issue for a few years until I put a tone oscillator inside the mic. All I do is push the switch on the rear and the tuner briefly chatters and all is tuned. I only run mine at 20 watts as I operate portable.

>
> The "AT-897" and the "AT-897 Plus" are not the same. There is a big difference. The "Plus" model is true one touch tune. You push the button, the tuner powers down the FT-897, switches it to AM mode, tunes for best match, and then returns the FT-897 back to it's original power and mode settings. As I recall the original AT-897 did not do this. You had to power down the rig yourself and switch to a constant carrier mode, and then hit the tune button, after which you had to manually return your rig back to it's original operating state. This is why I didn't buy the AT-897. Too much button pushing.

OK here's the problem. Operating system XP home, SP3. USB interfaces tried RTS-03 that works great with my VX-3R and ADMS software. The second USB to serial IF I purchased today is a Gigaware unit from radio shack. The software I REALLY want to use is the FTBasicMM memory management software. (Even paid the $15 for it). When I try to force the 897 to "clone mode" it won't. Never, ever ... refused at any speed with either interface set up. To make matters worst HRD will sink up and work great then drop out. The same is true for Virtual Legacy radio and FTBCAT won't sink up at all. The radio is a ACER-one netbook. It has worked perfect with my IC-7200 and with my CV-I interface used with ICOM radios I have had in the past...i.e. 718, 706, 703 and my present 756 classic.

So what am I missing. Do I have a screw up CAT port? Is this a common problem with this model radio? With all the ICOM and Yeasu radios I have had in the past I have NEVER had this much problem getting simple software to work. It is bad enough that the radio won't go into clone mode so I can get a radio image to add to, but why is HRD and the others working so great then all of a sudden drop out? Any suggestion will be greatly appreciated.

What serial to USB converter are you using? Is it a prolific driver for
PL-2303?

I am not sure what you are referring too. I have 2 different rs-232 to usb devices. One that I got when I bought the ADAMS software for my VX-3r. zero problem with that one, and I have used it with my PIC programmer and interfacing to a FT-450 before I traded it off for my IC-7200. Out of frustration I got the latest one sold by RS today. The model number is 26-949. I si USB 2.0 compatilble and has drivers for 98SE, ME, 2000, XP and vista. There is no reason for it not to work...as well as the other one.

An FYI I just move the radio and driver to my main computer and I am in the process of trying it here now...more later if it works..

Harry,

Your RTS-03 USB/serial converter used a FTDI USB chip - their USB drivers are reliable. Your new cable may not have the same manufacturer's USB chip in it - it could be a Prolific one; they are very common. Prolific USB drivers are a bit of a mixed bag; some versions work but others give problems. To check which drivers your cable uses do this:

1. Plug your USB/serial converter into an available USB port.
2. Click the Windows Start button and look for My Computer.
3. Right-click My Computer and choose Manage. Wait for a window to open.
4. In the left hand pane click Device manager.
5. Look in the right hand pane for Ports (COM & LPT) and click on the + sign to open the list of devices.
6. Look for your cable. If you are not sure what it is called then unplug it and note which item disappears, then plug it in again.
7. Double-click the entry for your cable. A Properties window should open.
8. Click on the Driver tab. There you will see the Driver Provider and Driver Version.

If the provider name is Prolific then here is a link to a Prolific PL-2303 USB driver installer on my web site that usually works with XP:

http://www.g4hfq.co.uk/dev/PL2303XP2K2028.exe

Download and run the driver installer.

Be sure to have the cable disconnected from the PC when you run it. If the installer initially asks if you want to un-install the existing drivers then say yes; then re-boot; then run the installer a second time to install.

If the Driver Provider is neither FTDI nor Prolific then I don't know what to suggest for your cable.

Email me direct if you get stuck.

Sorry for playing my own harp but in the files section you'll
find a mod (mine) that automatically switches the rig to batt mode
(reducing power to 20W max) when you pull the TXreq line
on the 3.5mm AUX plug, which is what the AT897 (non-plus) does.

Push the AT897 button, the radio reduces power, gives carrier,
the tuner tunes and everything switches back automagically.

For the plus, you don't need this.

One more sticky point.... the FT897 doesn't use RS232 perse..... RS232 is a 12volt level signal. The adaptors that most radios use translate the RS232 down to a 5 volt signal.... Just incase you are homebrewing an interface to the radio.

Just loaded both programs on a new Dell Netbook for portable operation. BUT for some reason they will not let me "now" run digital operations under the digital mode setting that I used to be able to run on with an older computer. The same holds true for my 817 and 897. I have to use USB setting on the radios to get any output. Does anyone know what setting I am forgetting to set?? Oh, BTW, this holds true on MixW and DM7800 with either a SignaLInk USB or RigExpert Plus.

Bob,

Thanks for your suggestion. I did download the driver and removed the Radio Shack installed one. Much to my surprised once the driver was loaded in now comes up as Gigaware and not Radio Shack. So guess it must be compatible. That's the good news, the bad news is I still can not get Clone to come up. Also running FTBCAT works briefly and drops out and so does Virtual Legacy Radio. I am on yet another computer and have not loaded HRD on it as of yet.

I have observed that the above softeware runs more stable at the highest com speed. I pulled the CT-62 appart and check some voltages and did find that when the software would stop running the the bias (power for the translator) dropped. Soooooo I built a 2 transistor circuit with higher voltage levels and taking the power from the 897 and not the usb/rs-232 cable. Well the two memtioned software worked a lot longer, but still dropped out and would not re-sync unless a full power down and restart.

I really am starting to think it is the 897 but not sure what would cause the radio to all of a sudden drop the CAT port or do something to the CAT port that was not intended. If you or anyone else has any suggestions let me know. In the meantime I plan this week-end to get this thing on a O-scope and see if I can catch any problems.

If you or anyone has had a simular problem with or without a solution let me know ... thank you.

You didn't say what operating system you're running on the "new Dell notebook" and that's the key to the problems you're having.

If it's truly a NEW computer, then it's probably running Windows 7. Check in the in the Yahoo Digitalradio group and also check the HRD support forums -- there are some special things one has to do in order to get the software interfacing correctly when running Windows 7.

Check with Signalink support (online) and RIGblaster support (online). They also have information about running under Windows 7.

By the way, my experimenting shows that a netbook needs at least 2 gig of RAM to be able to run digital modes. Anything less will often cause the computer to freeze up every so often.

I use my SignaLink USB just as I do on HF digital modes. The SignaLink connects to a PC via USB, and the radio via the Data jack in back. On VHF I normally use DOMINOEX-8 on FLDIGI with MULTIPSK as a backup. I can also talk APRS using AGWPE.

I've found that using RIGcat in FLDIGI makes the software confused, so I don't use CAT on VHF-FM (it works great on SSB modes). I've also found that the radio will only respond properly in PKT mode. I've been told that this isn't the "proper" way to do things, but it's the only thing that works for me.

That sound and smell usually indicate that a component has blown. If you open up the rig, you can usually see the blown component (as long as it isn't hidden from plain view). If not, you can smell around the boards with your nose real close to them and find the blown component as the smell will stay with it for a while.

Personally, I would try to identify what blew before I used the rig again.

How do you connect between the radio and the interface and the rig. What cables specifically and where specifically do you plug them in.

I'll ask a couple of questions that may seem pretty obvious and stupid, but 3/4s of the time, it's something obvious that someone has missed:

One thing that comes to mind is that the USB setting on the rig leaves the mic jack activated whereas the digital setting turns it off. That could imply that you're getting audio interface to the rig instead of wired interface (in other words, it could imply that the rig is picking up output from the computer's speaker and transmitting it that way). Question: when you transmit digital, do you hear the beeps on your computer speaker? That would mean that the signal is not actually going out the USB into the Signalink.

Do you have the rigs set to a proper input gain for the digital jack. Probably difficult to have that wrong on two different rigs, but I do have to ask.

Have you checked all the setups on the computer against the user manual for the interface? For example, did you go through the first time setup of the Signalink so that the computer identifies the Signalink and installs the driver software? Have you set up the Control Panel|Sounds correctly based on the Signalink instructions? What settings do you have in DM780 for: (a) COM, (b) transmit soundcard (can't remember offhand what it's called in DM780, but it's where you tell it to use the Audio Codec on the USB port), and (c) for receive source (same thing -- where you tell it to use the Audio Codec on the USB port).

Essentially same questions regarding the RIGblaster. Did you install the driver software for the RIGblaster and configure sound settings correctly? Did you set up DM780 correctly for the RIGblaster? There are a couple of things that must be set totally differently for the RIGblaster versus the Signalink.

You might even want to use Control Panel|Add or Remove Programs and remove any drivers that you see set up for the RIGblaster and reinstall. I don't think that there is a Signalink driver that shows, so I'm not sure how one might remove the driver for that.

Right, when using a sound card interface; I use the Signalink, you're supposed to leave the rig at 100W and keep the ALC at a min. using the Signalink. I use the 897 primarily for digital, only using it for voice when we go portable...

Help!! I had hrd installed on my old computer and it worked fine. I hooked it up to my new computer and get freq = 0. I have tried two different cat cables and different version of hrd and still nothing the cables are rs-232 style and the computer says the hardware is fine The cat port is set to 9600 baud and function is set to cat. yaesu said to try it on the old computer but I had already deleted hrd and upon reinstall it wouldn't work either I tried another radio and it wont work either it's frustrating. I tried auto detect on com ports and auto detect on baud rate any suggestions please don't hesitate to E-mail thanks, steve n8sms

Do you have HRD set to look for the correct COM port?

I have not operated psk31 but I can tell you that this mode runs at 100% duty cycle and with the radio set to its max. output of 100W, you are going to see SMOKE! I think you are suppose to run no more than 25% transmit power of your rigs max. output power.

I think that the idea is that with an ssb signal you can control the power level either by:
1. lowering the power and using a full audio level
2. by setting the rf at 100 watts and the audio level at a low enough setting that your rig is only putting out around 25 watts

The argument seems to be that if you lower the power level some rigs do not generate a clean signal.

My Acer Aspire 1 running WinXP has 1GB of RAM and I haven't had memory issues yet. I did have apparent RFI issues on Field Day, but I haven't seen any other problems. Do you have to run for a very long time before seeing issues?

grin XP on 1GB of ram? Oh, you have problems, you just don't realise they're there ;)
Seriously, shove another gig in, and sit in awe at the fairly substantial difference ;)
(Open Task Manager, and watch your memory usage.. XP on a 'normal' boot once it's loaded your virus scanner, skype, echolink, etc, is using 700-800mb of ram - doesn't leave much for HDD caching..)

Or upgrade to an SSD drive, no real need for caching HDD data in ram then.. I'm continually amazed how my Toughbook (1.2ghz Atom, 1.2gb ram, 64gb SSD) just totally and completely blows my garage PC (Core2Quad 2.67Ghz, 8Gb ram, 7200rpm 16mb cache SATAII drive) out of the water! Under a second to start MSWord :) And compared to my XYLs eeepc? well, even after taking that up to 4gb of ram, it still takes ~10 seconds to start MSWord... Think an SSD upgrade will be on the books fairly soon..

Although TBH, I'd actually attribute small notebook and netbook issues on digital modes to lack of CPU.. DM780 is quite painful when switching between modes on my little toughbook.. (or maybe it does normally take a second or two on 'normal' hardware, and I'm just spoilt by the quad-core CPU in the garage?)

Sorry for playing my own harp but in the files section you'll
find a mod (mine) that automatically switches the rig to batt mode
(reducing power to 20W max) when you pull the TXreq line
on the 3.5mm AUX plug, which is what the AT897 (non-plus) does.

Push the AT897 button, the radio reduces power, gives carrier,
the tuner tunes and everything switches back automagically.

For the plus, you don't need this.

HAM-tranceivers, like the FT897, are not build to operate 100 Watts during a long period, like transmitting 100 Watts by PSK.
The final-unit is becoming to hot.
Like during transmitting SSB and CW the period is shorter and the final-unit will become not to hot and will become cool by the blower.
Long transmissions, like PSK and RTTY, is better to run with a power less than 40 Watts.
Also the problem with transmitting high power, will disturb receiving signals by stations in the neighbourhood.
PSK is just made to transmit wit a low power!

Hi there,

Not very seldom when I am calling CQ in psk-mode, the other guy says my signal is strong but he cannot decode it. And I do not know why. All my settings should be OK. It looks like in those periods I cannot see my signal in pskreporter.info either. Then other times I can work long time making lots of QSO:s
The set up is: WinXPPro, HRD/DM780, FT-897, SignaLink USB. I must admit my antenna is not very efficient; a mobile whip. However I get very often congrats on my excllent antenna performance. How is it possible that even if my signal is strong, it is uncopiable?
Could it be just general conditions with QSB/QRN etc or do I have something wrong somewhere (for a long time apparently, hi)
Useful hints appreciated.

Ben

Danny,

1)
The bad props could be the the reason in most of the cases. But just wondering when my signal is supposed to be strong but it cannot be decoded. What else could it be?

2)
Just recently lots of discussion about the required rf power. One opinion is to use 100w and reduce it to abt 20 - 30w by soundcard settings. (I am not sure if the radio is after that still pushing all 100w to somewhere and running redhot?)

3)
The other idea is to never use the full radio output power in digi modes because of continuous duty-transmissions etc. and set it originally to that 20 - 30 watts?

4)
Somebody suggested that if you are not using the full rf-power,
your radio is not generating a clean signal.

5)
Are these things different in various radios. I am using Yaesu FT-897/SignaLink and IC-7200/USB-cable.

Lots of questions and contradictiory opinions in the air. I hope somebody could say the final truth.
If there is anything like that?

Check to see if anything that is plugged into the back of the 897 is only partially inserted. My rig has exhibited the behavior you described many times after I pulled the rig forward and inadvertently pulled the CW key's plug partially out. If the rig is turned on with the CW key closed, it will come up in a somewhat disabled "safe mode".

Ben,

I run the FT-897D with Signalink USB with Digipan software and never run the radio above 40 Watts and have had 599 signal reports with good data copy on most contacts. I do notice that when the person I am talking to says my data is garble, theirs is also. Have always chaulked it up to the props even though I still have a good sounding signal on the radio, it just drops down in volume. The thing about Amateur Radio is there is no set truth when it comes to operating on any mode.

Take last night for instance, I had 59 signal with North Sardina Island on 20 meter SSB on 100 watts but couldn't get a station in Portugal to hear me at all. Didn't change a thing. Just did work. Approximately five minutes apart from good contact and no contact.

Glad to help out! It actually is a good feature to prevent accidental tx on power up, but it catches a lot of 857/897 operators by surprise the first time it happens.

30663. Re: Decoding problem with my PSK signal

Yahoo group: FT897 (2010)
Date: 2010-07-24 15:47:19 UTC
From: JonP
Topic: 30654 Message: 30663

The recommended PSK approach for most radios, including the FT-897, is to set the power high and then adjust the soundcard so that the rig is running at about 25 or 30 watts (or 40 watts if you want, but that's a bit much for PSK). It will keep the ALC at or below about 1 bar. You want the ALC at or below 1 bar, otherwise your signal will be distorted AND you will create QRM for others on the band (you can sometimes see that when you see a signal on the waterfall with what appear to be echoes both left and right of the main signal.

There are a few radios, such as the Elecraft K2, where the proper approach is to set the radio for the desired output power. That has to do with how and where the audio is injected into the RF stream.

There are many reasons for garbled reception. One of the most common is the transmitter overdriving the ALC. In addition, there can be multiple pathing issues on long-path (i.e., DX) transmissions. Probably the most common is simply a very strong signal near your signal. Most rigs have their DSP in the audio stages. That means that a strong signal -- even if it's 1 or 2KHz away, will overload the IF (especially with AGC engaged, but even without it), thus causing all but the strong signal to become garbled. For PSK, it's best if the receiver has DSP in the IF stage and/or mechanical filters.

From: Jeff
Topic: 30664 Message: 30664

Hello All,

I was wondering if anyone on the group used cw with the plug and play interface with the 897 my main question is does the data jack allow cw transmit or do you have to use the breakin feature with the radio im using HRD any help would be great?
jeff kd4qit

30665. FT897D No receive on FM mode

Yahoo group: FT897 (2010)
Date: 2010-07-25 02:32:46 UTC
From: pjseraf
Topic: 30665 Message: 30665

My FT897D has no FM receive on any band. I first noticed it on 2 meters. I have the RF/squelch open and it's not tone squelched. The FM TX works fine but no FM receive on any band. This problem applies to the RX packet mode too. All the other modes seem to work fine. I have tried a cpu master reset and problem is still there. I was wondering if anyone on the group has any ideas. Any suggestions would be appreciated. I suspect a hardware problem..

tnx

Hi Phil,

I seem to be in the early stages of the same problem with my 8797D.
The 2 Meter RX is intermittently weak. I give the mic PTT a quick tap and that restores the RX. I have noticed this on 2m FM and SSB (Actually the only 2 modes I work on 2m). So far the 450 band hasn't had any problems.

From looking at the diagram and cogitating how the problem manifests itself, it's a lot like a dirty mechanical relay switching the antenna back to RX after transmitting.... In this case I'm thinking one or more of the switchover diodes that isolate the RX front end from the transmitter during TX may be going bad.

With all the other projects I have going on this problem hasn't been bad enough for me to take the 897 apart and figure it out properly.

Just some musings from me.

John,

Thanks for the info I'll take a second look at it. I too have too many projects going on and don't need another one. I just had the FT897D repaired by Vertex earlier this year. It had the bad ceramic filter problem which caused a a very high noise level on all bands even with no antenna connected. Vertex fixed that problem.

I also have the FT-450 and have had no problem with that rig so far.

From: stereoimage73
Topic: 30669 Message: 30669

Hello:

Every so often when attempting to tune with a AT 200pro (or in FM mode) my unit stays in transmit and will not "un" tranmit. The power meter stays pegged at 100 watts and often the only recourse is to power down the unit and then all is well....

Anyone else ever see this?

Thanks for any assistance or advice.

30674. Power extension UHF

Yahoo group: FT897 (2010)
Date: 2010-07-26 16:25:25 UTC
From: klokkenman
Topic: 30674 Message: 30674

I am wandering if it will damage my FT-897D if I run it at 40 Watt RF in UHF.
In the hidden menu it seems to be possible to boost up the rig a bit, and double the RF power on UHF
A Yaesu FT-7800 can transmit at this power in UHF, and it is just like the 897 limited at 50 watt on VHF.
Because of the surrounding buildings, I can sometimes uses a little bit more RF.
Maybe this will do the trick.

30675. Re: Decoding problem with my PSK signal

Yahoo group: FT897 (2010)
Date: 2010-07-26 18:18:47 UTC
From: faygopaygo
Topic: 30654 Message: 30675

Hi all,

In reading this post it brings to mind a question/problem I have with my 897/non D PSK setup. I try to set it up as suggested in previous posts ie. usb mode, full rf power on the radio, etc. It works, but I can never get my ALC below 2 bars and all posts say this is a no-no. Taking 2 bars as my lowest possible ALC reading (I figured maybe my meter is misaligned) I can never get over 15-20 watts out before the ALC jumps up over 4 bars. I use a Signalink USB interface, running DM870. There is an jumper option on the interface to increase audio out for certain radios could this be my problem/solution, as I have it at the low setting now. Any thoughts would be appreciated.

PS - This occurs with different antennas in different QTH's so I don't think it's a stray RF problem.

KG6WCA

--- In FT897@yahoogroups.com, "JonP" <jperelst@...> wrote:
>
> The recommended PSK approach for most radios, including the FT-897, is to set the power high and then adjust the soundcard so that the rig is running at about 25 or 30 watts (or 40 watts if you want, but that's a bit much for PSK). It will keep the ALC at or below about 1 bar. You want the ALC at or below 1 bar, otherwise your signal will be distorted AND you will create QRM for others on the band (you can sometimes see that when you see a signal on the waterfall with what appear to be echoes both left and right of the main signal.
>
> There are a few radios, such as the Elecraft K2, where the proper approach is to set the radio for the desired output power. That has to do with how and where the audio is injected into the RF stream.
>
> There are many reasons for garbled reception. One of the most common is the transmitter overdriving the ALC. In addition, there can be multiple pathing issues on long-path (i.e., DX) transmissions. Probably the most common is simply a very strong signal near your signal. Most rigs have their DSP in the audio stages. That means that a strong signal -- even if it's 1 or 2KHz away, will overload the IF (especially with AGC engaged, but even without it), thus causing all but the strong signal to become garbled. For PSK, it's best if the receiver has DSP in the IF stage and/or mechanical filters.

From: Clark
Topic: 30670 Message: 30676

The way I deal with background noise is to ride the RF gain control. I set the RF gain down to the point that I can hear the signal I want to hear clearly. When the station signs it over, there is little noise in the RX because the gain control is set to the signal strength of the guy's own signal.

I don't find the DSP noise reduction useful myself (none of them, not even the "good" ones) because of audio artifacts and the decrease in the higher frequency audio components. I find that my ears are better at determining the signal from the noise than a DSP filter (so far, I'm waiting for the next generation!)

YOU might find that a speaker that cuts off the high frequencies helps or that the DSP NR helps if your ears do not like that high pitched stuff. It is less piercing and fatiguing.

I would think long and hard about risking the finals by double the power. You only get 3 db for that, it is really a very small increase in signal. It is really easy to get 3 db with an antenna and leave the finals alone. If you are surrounded by large buildings, try a higher antenna or lose the 5/8 wave with low angle and get a 1/4 wave vertical that could easily boost your signal strength out of the hole (it has worked for me very well in cities with my mobile, the smaller antenna wins!)

Then there are small beams, which for 440, are really small and light. You can boost your ERP power lots more than 3 db and you get reduced interference on the sides and from the back.

Just my 2 cents.

Yeah, i wouldn't want to risk a $1400 rig for a 20W power increase.. I'd rather spend a couple of hundred bucks and shove an amp in there.. - I have a nice little asian-sourced VHF amp (mine is the little brother of http://cgi.ebay.com.au/2m-Band-85-Watt-Power-Amplifier-PV-85R-HIGH-POWER-/120383190524.. - they also have UHF ones, though i can't find one at the moment.) which takes the 5W out of my D7 H/T and pumps out a nice 50W on VHF, which lives in the wife's car since I finally got around to fitting 'proper' gear into my car :) Of if you're not mobile, I'd just build a nice high-gain antenna.. a coaxial colinear is trivial to build, and gives some very decent gain with enough elements :) (or hell, even if you're mobile ;) - I remember my first car when i got my license had a 1.5m PVC pipe sticking up off the roof with a coaxial colinear inside giving me 8dB gain ;))

There's obviously a reason why Yaesu decided to only put 20W out on UHF rather than something more useful - I'd without doing a lot of testing and reading of the CCT diagram, i'd be hesitant to play with the power settings too much..

Cheers,

DG

From: Don Taylor
Topic: 30665 Message: 30679

Phil, there are two FM Detector IC in the radio one is for Wide Band (Q1058) and the other (1080) for Narrow Band. The WB is for the FM BC Band the narrow is for the HAM Bands.

Does the WB work ?

Does the NB have any of the normal FM noise when the Squelch is open ?

If WB works and NB noise is normal most of the RX is O.K.

If the NB noise is not normal or missing we usually find that the IC (Q1080) is bad. The Chip is a 16 SMD. Also there are a couple of OpAmps and an electronic switch that the signal must pass thru. Further there are several Select Control Signals and Switched Voltages that have to be right to get the NB FM on line.

Suggest you get some very Professional Help.

Hi,
In the manual, on page 26 it talks about the DSP. While noise can't be eliminated it can be minimized....
Check out (Multi Function Row "p" [DNR, DNF, DBF])

To that end, for SSB, I have my audio bandpass (DBF) usually set to 2400 hz ([DSP LPF CUTOFF]) and the low end ([DSP HPF CUTOFF]) set to 500 hz. This cuts off a lot of high end hiss that the detector and early audio chain has and also the low cutoff makes overtly bassy stations more readable. To tweak in the best sound use the IF shift function to center the audio bandpass.

For FM operation the 500 hz low cutoff is good to eliminate transmitted PL tones... you may want to adjust the high end to 3 KHZ for a little crisper audio.

Using the IPO and DNR functions also help but I have heard the best improvement mainly in adjusting the audio filters to something a little less harsh sounding.... also a good "better fidelity" external speaker or headphones will help get things tweaked in as compared to the built in speaker.

This may be a very simple question that has been answered, and I've invested at least a bit of manual time, some searches on the net and here, but I can't find the answer. I apologize if I'm missing something obvious....

Is there a way to take the contents of a given memory and set the current vfo to that frequency with a few button pushes?

From: Steve Yates
Topic: 30670 Message: 30682

Vince,

In general I use the "IPO" (pre-amp off) for 15 MHz and below, use the "ATTN" for about 6 MHz and below. This depends a lot on the antenna you are using and the noise in your environment. I keep the RF Gain turned counter-clockwise until the S-meter is about the same level as the signals I'm listening to. In other words, I use the RF gain control to attenuate the noise level and restore the dynamic range of the signals. When the RF Gain is set to maximum (clock-wise) the AGC tends to make the noise floor the same amplitude as the signals your listening to. It compresses all signals to the same level making the receiver "seem" noisy.

It doesn't go into the VFO though. I've been stuck on this and have tended to unlock the dial and rotate it a bit. In fact any change from the memory settings such as changing tone mode will set the radio in VFO mode. It's a slight nuisance if you want to use the smaller dial to make 12.5kHz steps in FM mode, because while it's in MEM mode that dial changes memory.

From: cergender
Topic: 30686 Message: 30686

Hi there,

When you press momentarily "Mem/Vfo Ch" button (in manual page 13 item 14), it is producing a flag or some kind of picture of the letter "p" on the left side of the voltage indicaotr in display.
Anybody knows what it means? Apparently I cannot change the frequency when that thing is on. I could not find any explanation in manual.Could somebody please explain the meaning of that.

Regards,
Ben

It can be adjusted by one of the menus. I have what I think is the default setup which causes it to tune in 1MHz steps in VFO mode or to switch memory banks in Memory mode (if you have memory banks turned on). Press it again to get rid of the flag.

You can use it for changing other parameters, but I didn't see any useful feedback when I tried that on my older 897 (not D). If you set it to "RF Power" for example it would be nice for the power to show in the display while the button was in its pressed mode.

Don,

The Wide Band FM does work. It is the FM receive in the ham bands that's not working. There is no FM background noise with an open squelch. Transmit FM is fine. Packet mode has the problem as FM, no background noise. All the other receive modes work. I may have to send it to Vertex for repair as you suggested. These SMD repairs require the right tools and a steady hand.

Thanks for the tip. The Q1058 may be the problem.

30689. Re: Cleaning out the shack

Yahoo group: FT897 (2010)
Date: 2010-07-28 05:06:23 UTC
From: Steve
Topic: 30668 Message: 30689

A member suggested that I post my list to the group. Well here it is.

To the moderator: If this is going beyond the limits of the postings here on the group, please eliminate this posting. I do not want to misuse my privileges.

Please contact me off list if you are interested in any of these.

- Yaesu FT-897 (older model) serial number: 3C130277

+ This is one of the radios that can have a 'soft' mod done to it. Whereas the MARS mod can be done through software. The MARS mod has been done to it already though via hardware modification. I bought it that way.

+ mic has W4RT One Big Punch installed with the Heil #4 and #5 elements in it

+ Rig has the TXCO 9 installed but no SSB or CW filters

note: The mem/ch knob has a bit of 'wiggle' to it. From what I understand, this is a common problem with the 897's. Everything works as it should though.

- LDG AT-897 bolt on tuner

- LDG FT-Meter

- FP-30 Power Supply w/ Factory mod

- CT-58 Band Data Cable

- CT-62 CAT Interface Cable

- MMB-80 Mobile Bracket (New in box)

- 2 FNB-78 Ni-MH Batteries (slightly used)

- MLS-100 Extension Speaker

The Above are all together in a package. I do have these other items as well.

- MFJ 962D 1.5Kw Versa Tuner lll

- MFJ 945E 1.8 - 60MHz Mobile Antenna Tuner

- Yaesu YS-60 1.6 - 60 MHz SWR & Power Meter (Used VERY little. Virtually new)

- Heil Traveller Headset

- AOR 8200 Mk3U with Aceco Frequency Counter (very similar to the MFJ version)

- Ranger 2950 10m radio (very used)

I have had these items for a while and have not used them very much. I am just cleaning out my shack here and wanting them to go to a new home.

These are all in a non-smoking environment. While all the items are used, some have been used more than others while some have hardly been used at all.

I have tried to describe everything to the best of my ability. If there are any further questions, please feel free to ask. :-)

Once again, please contact me off list about these items. :-)

30690. Re: Need help with receiver noise!

Yahoo group: FT897 (2010)
Date: 2010-07-28 06:11:57 UTC
From: jsavitsky
Topic: 30670 Message: 30690

The basic settings to reduce the background receiver noise are written in above comments. There is a radical modification of I and II stage amps of 2nd IF which greatly reduce background noise. Both stages reduced their amplification by 3 times. This is done by soldering some SMD parts on the down side of the main unit PCB. Another good modification is published at the mods.dk named like "Slow AGC too fast mod" or something like that. And another very simple mod not to reduce the noise, but to enhance the sound quality is to solder 100 Ohm resistor on top of the internal loudspeaker terminals. This eliminates sound distortion caused by inproper PCB design of the TDA2003 sound amplifier.

> Because of the surrounding buildings, I can sometimes uses a little bit more RF.
> Maybe this will do the trick.

Regardless of the possibility of such a move, I would not advise such a move, I would suggest using an external amplifier giving perhaps 100W or more output. I would choose one with a preamplifier incorporated. The 7dB or more increase in power with an amplifier is more effective than the 3dB from the over-running of the output stage. Ideally, you could mount the amplifier in close proximity to the aerial and this will improve your station even more.

From: n8ulp
Topic: 30692 Message: 30692

I just recently purchased a nice used ft897d that had only been used for a 10 watt beacon for its whole life. Have not tried it on VHF UHF 10 meters puts out 80 to 100 watts with no problem but every other band only getting about 10 watts out on 2 of my meters. Power supply is sec 1223 22 amp. I have already tried a master reset with no luck. Not sure about the Second menu settings. Any suggestions?
thanks Sean N8ULP

30693. Radio - ATU interface

From: m0mgf
Topic: 30693 Message: 30693

I do not want to spend a lot of money (well it is here in England) for an interface to connect the FT-897D to the MFJ-993B. Has anyone tried a homebrew version, by directly connecting the two devices together?

From looking at the manuals,
Radio: TxD and Tx GND to ATU: Radio interface
socket
Radio: 13.8v and GRND to ATU: Power socket

Will this work? or why have MFJ inserted an interface, what is it actually doing?

Regards for any assistance

Please excuse me if this is a an ignorant question, but since PSK is transmitting on SSB, isn't the power output essentially the same if I adjust the modulation so the 897 meter set to PWR reads 20W whether the RF power is set to 100W or 40W?

It seems that many PSK elmers think that 20W modulation at the 100W setting will produce a cleaner signal than at 40W.

Do I understand this correctly?

Harry,

FWIW, I am running HRD and am connected to the FT-897D with the USB to CAT cable, USB-62, as supplied by RT Systems Inc. specifically for this radio. I followed thier directions and installed the RTS driver. Using the RTS routine I determined that the USB and driver would emulate serial port 5 and set things up accordingly. I also experienced the HRD and radio disconnecting. When it happens, HRD han gs up so bad that I can not stop the program. In talking with a fellow ham locally who is also expert in computers, he has suggested to me that M/S doesn't play well with com ports above the first 4 and that this could be the problem. So far I have not been able to resolve this.

Subject: [FT897] Re: CAT problem AAAAHHHHH! Update

Bob,

Thanks for your suggestion. I did download the driver and removed the Radio Shack installed one. Much to my surprised once the driver was loaded in now comes up as Gigaware and not Radio Shack. So guess it must be compatible. That's the good news, the bad news is I still can not get Clone to come up. Also running FTBCAT works briefly and drops out and so does Virtual Legacy Radio. I am on yet another computer and have not loaded HRD on it as of yet.

I have observed that the above softeware runs more stable at the highest com speed. I pulled the CT-62 appart and check some voltages and did find that when the software would stop running the the bias (power for the translator) dropped. Soooooo I built a 2 transistor circuit with higher voltage levels and taking the power from the 897 and not the usb/rs-232 cable. Well the two memtioned software worked a lot longer, but still dropped out and would not re-sync unless a full power down and restart.

I really am starting to think it is the 897 but not sure what would cause the radio to all of a sudden drop the CAT port or do something to the CAT port that was not intended. If you

or anyone else has any suggestions let me know. In the meantime I plan this week-end to get this thing on a O-scope and see if I can catch any problems.

If you or anyone has had a simular problem with or without a solution let me know ... thank you.

30698. Re: Decoding problem with my PSK signal

Yahoo group: FT897 (2010)
Date: 2010-07-23 19:57:15 UTC
From: pakjan830
Topic: 30654 Message: 30698

Ben.

I can completely confirm Danny's response. I use the radio in PSK with max 50W set in Menu 75 and keep Menu 37 (Digital Gain) open to adjust the incoming AF level on demand. I have reached stations in Spain from Singapore (12000 KM) with a simple mobile whip of 1.8 m length on a balcony pointing southward.

I am sure you checked this but here is the obvious:

- Are you in Digital mode? (Display shows DIG)
- Digital mode (Menu 38) is PSK31-U?
- Is your meter set to display ALC on transmit?
- When transmitting a PSK signal, you have adjusted Digital gain to just about show a deflection on the meter (but not yet)?
- When connecting a power meter the same shows you roundabout the power you set in menu 75 while transmitting?
- Are you confident that your sound card does not produce noise when transmitting? Your Signalink should have an isolation transformer which is good. Is there a chance you can monitor your own signal with a second receiver to check for distortion?
- Is the cable from the Signalink to the TRX well shielded?

The FT897 is a rock solid TRX and nothing much can go wrong. If you want to further investigate you might want to transmit a signal and receive it back from one of the WebSDR receivers (Google for it), that should show you exactly what others receive.

Regards,
Jan, DK3LJ

Subject: [FT897] Not able to tune 146.000 MHz and other problems.

I am unable to tune beyond 146.000 MHz on 2 meter. Drops back to
144.000MHz. On 70cm, same problem 430.000 to 440.000 the back to 430.000.
Also, on HF. on 40 meters, anything over 7.102.50 give me TX ERROR.

Thanks for any assistance on this one.

Bob K9ZHJ

'Funny, mine does the same - yours, like mine, is probably set to the
European market settings. If it is an old FT897 do a full reset, otherwise
check the jumper settings.

30700. Re: Netbook

Yahoo group: FT897 (2010)
Date: 2010-07-28 23:49:11 UTC
From: faygopaygo
Topic: 30694 Message: 30700

Rich,

I don't know if you received any answers yet, but I can tell you that any netbook made in the last year or two will easily run HRD. My ASUS 701 eeePC runs Windows XP sp3 with only 1G of ram, a 4G solid state hard drive and an 8G SD memory card. The processor is an old Celeron which maxes out at .9MHz and normally runs at only .58MHz. If you can, get XP sp3 unless you have a special need for Windows 7. Whatever you do don't get a netbook running any version of Vista! As long as you have an Atom processor (any of them) and a Gig of ram you'll be fine. More important is the size and quality of your display! Get at least a 10" display at least 1024x600dpi (HRD takes up a lot of display room) and try to get one that works well in daylight. This is the major fault of my 701, an 8" display that's dismal in any direct light, plus if you touch type the keyboard will not be pleasant. For peckers like me I find I'm actually faster on the 701. Most 10' display netbooks have tolerable keyboards but some have a few weird key positions. Try before you buy!
Make sure the netbook has at LEAST 3 POWERED USB ports. You will go through them quickly using digital modes. I always use a 4 port extender on mine in addition to the 3 on-board ports and still would like a few more! Get at least a 6 cell battery if, as I presume, you plan to operate portable. I also use a Tigertronics Signalink USB interface. It takes up a USB port but makes life easier in the digmodes. Also, I run Outpost Packet Message Manager software on VHF with no problems and it's free!

Hope this helps.

30701. Noise from CAT Interface

Yahoo group: FT897 (2010)
Date: 2010-07-29 05:37:48 UTC
From: pakjan830
Topic: 30701 Message: 30701

I operate my FT-897 with a microHAM USB Interface II for PSK/RTTY operation. Since day one when I bought the microHAM I noticed that whenever an application accesses the internal USB chip (FTDI FT232R) the receiver noise level goes through the roof (S9).

Once I stop accessing the chip (by terminating the driver), things go back to normal. I have tried the same with an older version of the microHAM interface which uses the FT232BL chip and this one works perfectly fine with zero noise.

My grounding situation is difficult as the shack is on the second floor and the best DC ground I can get is a thick wire to the copper water pipe. Antenna-wise I am operating into a dipole. Grounding the TRX certainly helps but still I can see the s meter jumping up at least 1 level when the chip is in operation. USB cables are shielded (does not make much of a difference here to use unshielded ones). The PC is a MAC laptop and can not be grounded for its physical design does not allow access to a grounding point but operating the laptop independently does not produce noise that I would have noticed. Noise stops 100% once I change the antenna for a dummy load (so I assume the noise enters the TRX through the antenna).

What I have done in the past was to just not use the CAT side of the interface at all but only the audio separation transformers and ket the rig through VOX. That of course prevents me from being able to use any CAT features.

What else can I try to get the noise level down?

30702. computer monitor noise on 50MHz

Yahoo group: FT897 (2010)
Date: 2010-07-29 07:51:20 UTC
From: davekh@cix.co.uk
Topic: 30702 Message: 30702

Earlier this year I setup a new radio shack and thanks to poor UK digital-broadcast signal levels at my new QTH meant a
20" TV became spare as a monitor and it worked well - failed to give me the highest resolution but did the job. (Not
quite the NCIS office but on the way ;-)

However when I did the monthly RSGB 50MHz evening contest I noticed there was a lot of noise (S7~8) when I pointed the
beam over the shack - and much less (hiss) when pointed elsewhere. Switching the TV off completely cleared it - so I
moved back to using a small-ish monitor - which still makes noise on 50MHz and makes weak ssb difficult to copy (0 on
the meter but the crackle was intrusive).

I can log on paper for these contests, but I'd quite like to equip the (Dell 15") monitor so that is doesn't do this (or
replace). The monitor is at least 4 years old and still very capable but space limitations mean its always quite close
to my FT897nd.

The most I could move it and still operate comfortably is about a foot away, but still get noise thats enough to make 6
meters uncomfortable to listen on for ssb. It does seem to be the monitor itself and not proximity of cables. I can't
try DVI though as my radio PC doesn't have it.

Any thoughts on this - are more modern monitors better at not transmitting hash on 50MHz?

Thanks

Stuart
You are correct!
To transmit 20 Watts with PSK, the signal is indeed cleaner.
To transmit with 100 Watts the final unit will become to hot
By 40 Watts the final unit will have no problems with the heat
PSK is indeed a mode to transmit wit a power lower than 30 Watts.
I have with 5 Watts PSK a better result on HF and 6 Mtrs than transmitting 100 Watts SSB

Rick,

We've had several of these in our household. I passed on a couple to my kids, and now have a fairly new Acer. I like it. All have somewhat cramped keyboards, but it's not all that bad. My Acer has Windows 7, and so far I've not had any issues, but many prefer to use XP if they can still find it. Vista was not suited for a netbook.

By all means, get one with a 6 cell battery and a 10 inch screen. I also had an HP, but didn't care as much for that one as it didn't have dedicated page up and page down keys, which my Acer does have--I use those keys a lot!

You will probably want to add an external optical drive, but I suppose it's not absolutely necessary. I think it is, and I found one made by Samsung that works really well. One I had from Dell was troublesome!

Lots of them out there, but I think the Acer, the ASUS, and possibly the Samsung models are the most highly rated. Costco sells the Acer I have for $300, and that's pretty cheap.

Rick
I use several netbooks.
The Asus 1000, great netbook and still around. 10" non shiny screen, all solid state, (ie no hard drive). Battery lasts 7 hours, and I bought a larger battery on Ebay. 12 hours out of that.

The Asus 1000H, same as above but with 80 or 160GB hard drive. Excellent too. XP

The Packard Bell Butterfly XS. About 360 UKP. 11.6" screen and has DVD drive! Has W7, but can be upgraded to XP. Shiny screen.

Regards
Jerry

Rick,

My suggestion would be to get one that I has a stereo mic input just in case you ever decide to play around with some of the SDR kits out there such as the softrocks or the kits from Genesis radio. You'll need a stereo mic input if you decide to use the internal sound card.

From: Sam M
Topic: 30707 Message: 30707

I had some issues with noise from my PC/ monitor as well. I found that the power phase setting on the monitor can be adjust to limit the interference. I think I changed mine from 60 cycles to 50 with a noticeable improvement in less hash on the receiver. Just a thought , good luck.

Jaap

Thank you for your informative reply. The question that seems to come up over and over again is where to set the RF Power (menu 75) on the 897 and then what level of modulation to apply to that for a clean PSK signal. A rule of thumb that I have read suggests modulating to about 20% of the output power setting.

That means if I want a 5 watt PSK signal I would set the RF Power to 25W and adjust the modulation to read about 5W with no ALC. If I want a 20W PSK signal, I would set the RF Power to 100W and adjust modulation to 20W. By this standard setting the RF Power to 40W and modulating at 20W would not produce as clean a signal.

This suggests that the highest power clean PSK signal with the 897 should not be much more than 20W. What you are saying seems to be to start with 5W, because even 20W may not be necessary.

Is this how you operate PSK with the 897?

Thanks & 73

From: iz0inx
Topic: 30693 Message: 30709

I believe you are talking about the MFJ-5124K/Y.

Yes, I agree with you, it is unreasonably expensive and, in my opinion, absolutely useless. I don't know whether your solution will work, what I know is that in the interface there is a PIC, I believe it works as protocol converter, so, unless the protocol (and the voltage levels) of the MFJ is compatible with the Yeasu one, it won't work.

The MFJ-993b can work in "Auto" mode. Just push the "Auto" button and when you transmit the tuner will detect the RF and the tune process will automatically start.

I know, you have to produce RF, so the options are to whistle into the mike when in SSB or switch to AM/FM and push the PTT.

I also didn't like that solution so, what I did, is to build a simple and cheap interface which detects the "tuning" status (started by pressing the "Tune" button on the Tuner) and put the RIG in the TX mode by closing the ring and the sleeve contacts of the ACC socket on the rig.
In other words, it acts as the Y-ACC cable when connected to the LDG AT897 tuner.

This way, when I want to tune, just push the "tune" button on the tuner. Then the RIG will produce RF till the tune process is completed. Very simple.
An improvement would be to add a low negative voltage to the tip on the ACC, so that the power is reduced.

Hope this is helpful
cheers,
Fil IZ0INX

No brainer. Go to Office Depot and get an Acer Aspire One with 10.1" screen. $299. Buy a 2 gig memory card and replace the 1 gig it comes with. I use HRD and the programming apps for the Icom 7000, Yeasu 897D,and Kenwood TM-710. Good little machine.

30713. FT-897D adds non-ham bands to UP/DWN band-scan sequence...

Yahoo group: FT897 (2010)
Date: 2010-07-30 05:34:44 UTC
From: Rob Stampfli
Topic: 30713 Message: 30713

I'm a relatively new owner of an FT-897D. One thing I've noticed is that if you tune to a frequncy outside the ham bands, and then use the band UP/DWN buttons to jump from there to the next higher or lower band, it appears the 897 remembers where you came from and inserts the new "band" in the sequence that is traversed by the UP/DWN buttons.

For instance, if I dial down to the AM broadcast band and listen to a station there, and then jump back to 160m, I find that, on that and only that VFO, the AM broadcast band has been "activated" and forever becomes a part of the UP/DWN search sequence.

My question: Is there some way (short of a full reset of the 897, which works) to remove these non-standard bands? I like to listen to unusual frequencies occasionally, but I'd prefer not to have to traverse these non-ham bands forever more after having done so.

Any ideas? Am I missing something obvious?

Thanks in advance,
Rob / KD8WK

30714. Re: [FT897] FT-897D adds non-ham bands to UP/DWN band-scan sequence...

From: Carl Wulfestieg
Topic: 30713 Message: 30714

Rob-
That's easy- Just use "Band-Down-Up" to go back to the "non-standard band"- Then use the VFO to tune into a ham band- You'll find the "non-standard-band" has disappeared- Of course you may now have two of the "same" ham bands- Like two 20 Meter bands- Or two 40 Meter bands- It's just the way the 897 works- I just live with it-
This same thing will happen whenever you tune to a "strange" band- It will always be there- Just use the above to get away from it- Good Luck-

Stuart,

I have found from experimenting lately that I get the best reports on my signal on the FT-897D in PSK if I have the RF set at 100W and adjust my Signalink USB to just barely having a indication on my ALC. Everyone tells me that my signal is much better. I was running the 897 at between 20 and 40W and people kept telling me that my data was dropping out. Now I don't seem to have that problem unless the props are real nasty.

> Rob-
> That's easy- Just use "Band-Down-Up" to go back to the "non-standard band"- Then use the VFO to tune into a ham band- You'll find the "non-standard-band" has disappeared- Of course you may now have two of the "same" ham bands- Like two 20 Meter bands- Or two 40 Meter bands- It's just the way the 897 works- I just live with it-
> This same thing will happen whenever you tune to a "strange" band- It will always be there- Just use the above to get away from it- Good Luck-

Thanks for the suggestion, Carl, but my 897D doesn't seem to work that way: If I do dial up into the next ham band and then hit the UP button, it takes me to the next higher band in the sequence. If I hit the DWN button, it takes me back to where I started -- to the band and frequency I don't want.

The algorithm seems to be that Yaesu divides its receive spectrum up into many bands: (1) ham bands and (2) the areas between the ham bands, which are linked into a circular list. The ham bands are initialized (on RESET) with the frequency which is the start of that band, and the non-ham-bands to some NULL value, which is skipped. When you use the UP/DWN buttons, the programming determines which band the current frequency is in and stores that frequency and some other details (like mode) in that band's list entry, so if you later go back to that band, you're right where you were the last time you left it. (That's convenient.) However, if you use the UP/DWN buttons from a non-ham band, it overwrites the initial NULL with the frequency you were at, and then it becomes part of the sequence, presumably forever.

What I'd like is to be able to NULL out a band, so it is removed from the search sequence, but I've yet to figure out how to do this.

Thanks again,
Rob

Rob-
In your manual, look at the section "Operating Band Selection". In my manual, it is on page 20. There is a "circular" diagram showing how BAND(DWN) or BAND(UP) moves from one band to the next. Maybe that will help to explain it.

30719. Mobile Installation HELP

Yahoo group: FT897 (2010)
Date: 2010-07-31 13:46:43 UTC
From: michael.dunthorne
Topic: 30719 Message: 30719

Now that time permits, I am trying to get more /m contacts however no matter what I try I keep getting s9+ noise from my car.

I connect the FT897 via the cigarette socket in the dash but when the engine is running I can not hear anything but QRM at over S9. I have tried switching the car off and the noise drops away but I am worried that after a good QSL that the battery wont have enough juice left to start the car. Plus I didnt want to risk any damage to the battery. Can anyone offer me any advice on how to get a good mobile setup for my FT897 that fits into an 04 Fiat Punto.

At the moment I am using a Watson 80m whip and a tri-mag mount.

Thanks for any advice

Mick

GM Mick -

Your first mistake is utilizing the cigarette socket. It is really not a sufficient power source and may also pickup noise from the instrument cluster.

You haven't mentioned the antenna configuration...Mount location and grounding.

Best bet is a direct run of #12 or #10 stranded wire from your battery terminals to the rig. Presuming the plug wires, alternator etc. are in good shape, most of your noise problem should disappear.

Running ground straps from the bonnet (hood) to the body might also help. If the antenna is on the boot (trunk), I would also suggest a ground strap from the lid to the body of the vehicle. Of course the best place for the antenna is always center of the roof, but with an 80m whip, this would be impractical. :-)))

Mick,

I suspect that the noise is coming from the engine electronics. I ran into the same situation as you a few weeks ago when I was testing a 2-meter Moxon for a 2-meter AM net we do here locally. I was connected directly to the battery. When I notice the voltage going down, I started the engine. The noise was so bad I had to sign off for a bit while I charged up. The noise was only present when the engine was running. With the engine off and the ignition switch on (read everything else was powered up) the noise went away. I do not have this problem with the FT-1900 that's installed in the same vehicle and it is connected to the lighter socket.

I do think you should go ahead and connect the 897 direct to the battery, though so you can get full power to the rig.

I wanted to share my experience with HRD. I could not get the app to connect with my laptop. I tried all combos of settings but it wouldn't connect. I was about to give up but had one idea. I brought the laptop to work and asked the IT guys if they could test the serial port. They used a loop back plug and diags and tested the DP9 serial port. Sure enough the port was bad, it failed all the transmit and receive tests. I borrowed another laptop and HRD connected fine. I wanted to share this to help anyone with HRD connection problems to check the DP9 port. I almost had given up!
Thx
Bart

> Thanks for your suggestion. I did download the driver and removed the Radio Shack installed one. Much to my surprised once the driver was loaded in now comes up as Gigaware and not Radio Shack. So guess it must be compatible. That's the good news, the bad news is I still can not get Clone to come up. Also running FTBCAT works briefly and drops out and so does Virtual Legacy Radio. I am on yet another computer and have not loaded HRD on it as of yet.
>
> I have observed that the above softeware runs more stable at the highest com speed. I pulled the CT-62 appart and check some voltages and did find that when the software would stop running the the bias (power for the translator) dropped. Soooooo I built a 2 transistor circuit with higher voltage levels and taking the power from the 897 and not the usb/rs-232 cable. Well the two memtioned software worked a lot longer, but still dropped out and would not re-sync unless a full power down and restart.
>
> I really am starting to think it is the 897 but not sure what would cause the radio to all of a sudden drop the CAT port or do something to the CAT port that was not intended. If you or anyone else has any suggestions let me know. In the meantime I plan this week-end to get this thing on a O-scope and see if I can catch any problems.

30724. Re: CAT problem AAAAHHHHH! Update

Yahoo group: FT897 (2010)
Date: 2010-07-31 23:22:53 UTC
From: harry latterman
Topic: 30633 Message: 30724

Thank you for the feedback. My problem is a bit subtle. All of my computer (2-acer-one netbooks, Toshiba laptop and HP desktop) all have USB but no DB-9 port. So all serial com has to be run through converters. I have the one that came with my VX-3R software and the Gigaware that RS now stocks. It was recommended that I down load a driver called PL2303 for the XP and I did. I removed the RS driver and low and behold the driver recognized the product and listed as such.

But no luck. I can not get the FTbasicMM to force the radio into clone mod, thus the software I paid for, for memory management, has been a waste of money. I can get HRD and Virtual Radio to load and run but both randomly drop out. Basically the FT-897 CAT port looses it. Same for FTBCAT. That one sometime syncs and runs ... then also stops.

The only thing I have not tried is to dig up a old PC that still has serial ports and give it a try. I never, ever had this problem with any radios I have owned and traded i.e. FT-817, IC-703, 706, 817, FT-450, IC-756 to name a few. All I can say is the FT-897/D with filters, DSP, internal PS and LDG tuner is a great fun package. But using the CAT port totally sucks. I am glad that it is my knock around radio, and not my serious one. I'll stick with my IC-7200 and it's no brainer interface. One cheap USB A/B cable. Free download software and fully operations HRD, FLDigi, Digipan, etc in 30 minutes or less. NOT ONE CAT PROBLEM... EVER... So far my feeling is the FT-987 CAT design stinks.... BTW I did build two other different CAT ciruits with good RS-232 levels and they did not work either.

So maybe I have to pick up a 10 yr old laptop with BD-9.... but then again I probably will stick with ICOM unless someone can come up with a fix. Anyone have any other suggestions?????

Thank you again

Quick question.. - Does it just lose it randomly while you're receiving? or only after transmitting (or hitting tune on your ATU) ?

I've just replaced my garage PC, and gone from one in a shielded case sitting in a shielded rack, to a normal old desktop pc case sitting on a shelf above the workbench.. And all of a sudden i've gone from having a perfectly working PC, to having one which keeps losing USB devices 90% of the time I hit transmit or tune.. (which of course includes the USB Cat cable.) Un-plugging and re-plugging the Cat cable from the USB hub gets it showing a status LED on the hub again, but HRD seems a little un-friendly when its COM port dissappears, and won't even allow me to do a clean shutdown.. - have to turn the computer off at the wall, and power it back up to get HRD able to access the port again..

Having had this problem before, I'm 99% sure it's just a sheilding issue (note: none of my gear outside of my comms rack is tied to earth with anything other than the earth line in the power cable..), so when i get some time I'll be running a ground wire to the case of everything, and expect it to come good.. (it did last time I had this issue, which was mainly caused by the dealer I bought my antenna off (A 'TEV-1', an 8.5M tall vertical) swearing I had to have a 4:1 balun connected between it and the feedline.. Pulled teh balun out, and all of a sudden it wasn't so far out of match that the feedline ended up radiating, and everything came good.. Having just added a rotator, and moved the antenna up the a metre above that (so the guy wires which acted as radials are no longer at the base of the vertical, but about 1.5 metres below it, I'm guessing it's a combination of bad match on the antenna, and lack of good earthing in the shack here..

Anyway, sorry, I got rambling.. The main gist of my post was - if it's 'losing' the port only after transmitting, make sure everything is tied to earth, shove chokes around all your USB cables (even with everything 'sorted', I've always had to have a choke about 30cm down the cable from my microsoft optical mouse, or it'd turn off for about 10 seconds whenever i'd transmit..), and maybe even try shoving your USB hub (if you're not plugging in directly) inside a metal box.. - or wrap alfoil around your USB dongle, and make sure that's shielded..

Cheers,

DG

This problem is common with all the software that I listed last time and in ALL case I never hit the xmit button. The USB to serial to CT-62 cable is plugged directly into the FT-897 CAT port. Two different manuf. USB to serial converters and 3 USB drivers have been tested. An no apparent serial handshaking for Cloning so the FTBasicMM memory manger can not sync up.

So this time no leaky RF just random drop if com port. Thanks anyway

I'm coming into this discussion late (and have not read the entire thread), but note that there is a significant discussion on the "Ham Radio Deluxe" web site forums, about certain USB-to-serial converter (ie, those with "Prolific" brand chips) not working well with Windows 64-bit systems. I had the same problem (with both HRD and Icom software), and when I used a true serial port, the problems when away.

Note that the "Prolific" converter chip is very popular, and is in many manufacturer's products. Note also Icom apparently uses the "FTDI" brand of converter chip, which has a better reputation for reliability.

30728. Re: LDG AT-897 versus the 'plus'

Yahoo group: FT897 (2010)
Date: 2010-08-01 15:19:42 UTC
From: klokkenman
Topic: 30062 Message: 30728

I thought the repairing of my AT-897 non plus tuner was successfully, and mostly it operates just fine.
Strange enough my rig does not transmit with this tuner connected in the range of 28Mhz.
I key the tuner to tune, and it uses a stored setting. I thought that maybe a relay in this setting would, again, not respond correctly, and gives an open line in the RF circuit.
Using a vertical and a dipole it doesn't seem logical that both antennas are using the same settings.
The rig is responding the same at both, the vertical and the dipole.
I forced the tuner to search for new combinations, and kept it keyed for a few seconds.
After this reset the rig functions fine. But sometimes it will happens again. Is it an inbuilt protection in case the tuner fails tuning within specifications?
A local HAM operator did provide me the manual of the non plus version, but I can't find any information about this. The same happens at 50Mhz.
Is anyone having the same problems?

Rob

A couple of items that might help. First, agreed run power direct from the battery and fuse both lines. Second, if possible take an electric drill and twist the power lines. This will help reduce noise coming in from the power lines acting as an antenna for engine noise. Third, update you spark plug wire harness to a high quality and if possible shield type. Lastly, if you can get them and if it is possible in today's car to change them without pulling the engine trying finding resistive spark plugs. These are designed to reduce RF from the plugs.

Hope this helps a little.

Alan, is to say the least, opinionated on somethings, however when it comes to mobile operations he will have the answer to most mobile problems someplace on his site!
I spent over a month reading thru the site before I went mobile and have had none of the problems you typically hear of in mobile operations.
Have a LONG look it'll be worth the time!

I just bought a serial CT-62 cable on Ebay and run it through a serial to USB converter I had lying around. I set menu item 29 to "CAT" (I may have the menu item # wrong), and had to tweak the assigned Com port in device manager to match up to the one I had set in my logging program. At first the radio wasn't recognized. So I stepped down the serial port baud rate from 9600 to 4800 and wah lah, its works fine. I'm wondering if your problem my be related to the baud rate?

I set them every combination possible. I did discover that my RS Gigaware converter is a Prolfic design and my RTS-03 is a FTDI design...so much with both being the same. They both work the same. HRD and Virtual Radio work then drop out no matter what setting I use, and FTBasicMM will not push the radio into clone mod so I can not do any memory management. I love the radio is all way...but this CAT thing is really pissing me off....

Set to CAT, used all three baud rates. Now set for 4800. I have both converter designs. That is One is Proflic and the other is FTDI. I also went on line and found the latest drivers for both. NO luck. I am running XP home with SP3 and all 3 computers. (Desktop, Netbook, Dual-Core Toshiba Laptop). No luck...HRD runs for 2 to 10 minute (no xmit ever) then drops out. FTBaicMM memory manager will NOT go into clone so no memory management. Radio had full rest also and all fucntions are 100%. AAAAAHHHHHHH!!!!!

Harry
If everything in the radio is ok, if the settings for the serial/usb converter is ok and if the driver software is ok -
all of which looks like they are from what you have said - it sounds like some other program might be using that virtual
com port and still running while you think its not - or just still running?

Is there anything else running - like a weather station or something you have on all your systems that you think might
have need to talk to the USB port or the USB/Serial port?

Perhaps look in the tast manager to see if anything you think isn't running - may still be?

Sounds like you have HRD working .. and then after 5-10 minutes you lose the COM port connection. I assume you are not running any other programs -- or trying to run FTBaic at same time as HRD -- and have the PC firewalls etc turned off.

Since this happens on all 3 PC's it appears your issue is with the CT62 cable and not with any radio or PC menu settings: most probably the cable is defective or not seated properly in the radio port.

I have an older CT62 cable (square rubber connector) and had to shave it with a razor into the proper round condition to get a good fit.

Sorry; I have no knowledge about FTBaic program. It's not clear what you mean by 'no transmit ever' -- hopefully you are not trying to get the CT62 to act as a TX/data-port cable.

Hope you get it working. My 897 has been flawless with 897/AT897 combo for years.

For what it's worth, I have problems with XP SP3 when attempting to add USB devices to my Lenovo which have not passed the 'Windows Logo Testing"(eg. my old Headset or old WebCam). Microsoft advise that the system may become unstable if I proceed with the installation.

So I installed the USB's anyway a couple of times to see what would happen. Although my HRD runs from a DB9 seial port at 4800 baud, it still crashes after a while and sometimes the computer crashes as well!

These devices work fine with XP SP2 on two other machines.

Fortunately, doing a System Restore returned everything to normal........

I have owned my 897D for about 2-3 years. Absolutely love the radio...use it in the shack when not using my FT-2000.

I turned the radio on today....cannot change bands with the BAND buttons, cannot change mode with the MODE buttons. The rig will not transmit with the microphone...cannot check CW since it is stuck in LSB. I tried several microprocessor resets as described in the manual (page 65 I think it is) with no luck. The radio stays disconnected from power and antennas when not in use.

The radio will receive, the VFO knob(s) will allow you tune/change frequency.

I will send the radio to Yaesu once I hear a response from the service center.

Any thoughts....I plan to keep the radio should the fix(s) not be all that expensive.

I purchased the ADMS-4BU Yaesu control software with the USB interface. It works perfectly with my Toshiba laptop. The software lets me load/save the radio information. The USB cable works great with Ham Radio Deluxe CAT control. The program and cable was $50 at HRO.

I have used this through the rear CAT jack and through an homemade adapter for the CAT function on the mic jack.

I use a SignalLink USB for the signal interface and a FoxDelta USB Rotator controller.

I run these USB items through a powered USB hub to reduce the load on my computer.

Seconded.

I get MUCH better results with this technique, although I keep my Signallink USB just out of ALC (no bars) and the power setting cranked open to 100 in the secondary menu. The "PWR" reading shows ~30w emitted when set up like this during transmit and those hearing me report that my signal is clean without splatter or IMD evident.

(Now to get a nice long stick up in the back yard with some radials as opposed to the dipole I'm running on now....)

"Now that you have the rig set up properly for voice you can set the audio drive level from your computer to your rig.

Do not change your basic mic. settings.
Turn off your rig's speech compressor. Confirm that your RF drive/transmit power control set to maximum.

Double click the little yellow speaker icon in your computer's system tray.

Adjust the master volume control (the one on the left) and the wave volume as high as needed
to drive your rig properly; generally between 1/4 and 3/4 of the way up. The RIGblaster's "audio level" control is used to match the computer to the radio, a one time setting.

Set all of these controls so that none are near all of the way up or down. Remember that all of the adjustments are all cascaded (in series), and they all interact.

Your final setting should produce approximately 50% RF power output from your radio.

Warning: you should not exceed the AM, FM or RTTY power ratings of your radio.

After all settings are completed, check to make sure your ALC meter is below limiting.

Note that if you run your sound card at maximum, and the RIGblaster level turned way down,you will have distortion from your sound card and a poor quality signal." Quote -> west mountain radio nomic manual

30747. Re: FT-897D adds non-ham bands to UP/DWN band-scan sequence...

Yahoo group: FT897 (2010)

Topic: 30713 Message: 30747

Rob,

I've found to remove an out of hamband band I change the VFO frequency to somewhere out of the way.

eg:

Been listening around 8.6mhz I find that if I go from 7mhz to 10mhz I step through 8.6. If I now listen on 31mhz then step down to 10mhz the next step is now 7mhz. Now if I go from 28mhz to 50mhz I have 31mhz in the band sequence. I keep the sequence there. When I've been listening around I make sure I always go back to 31mhz.

Hope this is clear and is the answer to your question.

From: B Young
Topic: 30748 Message: 30748

Hello FT-897 Group,

I was thinking of enabling the speech processor on the FT-897D. Has anybody used the speech processor? What type of results (audio reports have you received?) Does it make any difference being enabled in pile-ups? If so, what settings for the speech processor did you use?

Strongly considering purchase of 897D for primary use on CW and secondarily data; but do not want to shell out more big bucks for narrow filters. Question: is the dsp filtering adjustable and narrow enough for contest level cw?

Thanks Colin! After I posted my original query, I did observe that
the extra bands that had been integrated into the band UP/DWN sequence
seemed "fluid" in that they changed and moved from time to time. As
you state, (and on further investigation) it seems that there is one
"floating" band. Actually, this is a pretty nifty feature. I just
wish Yaesu had taken the time to document it correctly in their manual.

(For now, I've been setting my floating band to 15 Mhz, which is our
WWV time standard frequency.)

Thanks again,
Rob

30751. FT-897D Tricks of the Trade sequence...

Yahoo group: FT897 (2010)
Date: 2010-08-03 06:06:56 UTC
From: Rob Stampfli
Topic: 30751 Message: 30751

Here's something I've figured out about the 897 that may be of interest to some of you:

Rather than using the "F" key to enter the Multi-Function select, I've been using the DSP key. Not only is it physically adjacent to the MEM/VFO knob, but it forces the rig to row "p", which sets a known starting point for my search. So, for instance, to get the the IPO/ATT keys, I hit DSP and then spin the MEM/VFO three clicks CCW. To get to the KYR, it's DSP and six clicks CCW. VOX is DSP + 5 clicks CW.

Memorize those combinations for keys you regularly use, and you can operate these function almost without any visual feedback at all.

What other neat tricks have you FT-897 owners figured out concerning the operation of the rig?

Rob

30752. FT-897 and Ham Radio Deluxe sequence...

Yahoo group: FT897 (2010)

From: Rob Stampfli
Topic: 30752 Message: 30752

For those using their 897 with HRD or a similar computer driven program, I'm interested in the following: It appears HRD has no way of turning the IPO and ATT functions on and off. It also apparently has no way to flip the RF-Gain and Squelch functionality (what the secondary pot of the Volume Control controls).

I understand the 897 probably doesn't export computer control of the Memory functions, and since the Volume and RF-Gain/Squelch control are actual pots instead of pulsers, these functions are no doubt incapable of being controlled by the computer, too.

But, are there really no computer commands that allow for selecting IPO, ATT, and RF-Gain vs. Squelch functionality? Or, for that matter, things like BK?

Finally, if you prefer another control program to HRD, I'd be interested in which on you use and why.

Inquiring minds...

Subject: [FT897] Semi-Dead FT-897D

I have owned my 897D for about 2-3 years. Absolutely love the radio...use it in the shack when not using my FT-2000.

I turned the radio on today....cannot change bands with the BAND buttons, cannot change mode with the MODE buttons. The rig will not transmit with the microphone...cannot check CW since it is stuck in LSB. I tried several microprocessor resets as described in the manual (page 65 I think it is) with no luck. The radio stays disconnected from power and antennas when not in use.

The radio will receive, the VFO knob(s) will allow you tune/change frequency.

I will send the radio to Yaesu once I hear a response from the service center.

Any thoughts....I plan to keep the radio should the fix(s) not be all that expensive.

I've not used the internal one. I did use an external Behringer Shark 110 with one of their vocal mics to very good effect. It just needs a permanent shack setup to leave that kind of kit laid out.

Rich -

In my humble opinion there is no substitute for a CW filter.

Although my prime rigs are a Drake TR7 with CW filter(s) and a FT1000D loaded with filters, my FT857D's both have Inrad CW filters. I've operated the 857Ds without the filters (relying filtering available in the rig) and there is no comparison.

If you like to operate CW as a main mode...Invest in the filter. The filters are "plug and play" and very easy to install...No soldering.

I would suggest an Inrad 500Hz filter...The 300Hz is bit too narrow.

Rich,

I agree with the other posters. However, using the FT-897D's DSP filters is no different then using audio filters that were popular with rigs from the 70's. Keep the RF Gain throttled back so that the AGC doesn't get pumped by signals outside of the filter's bandpass and you can often get by pretty well.

Nick -

I prefer the 10 gauge. However the braid is much more flexable.

One problem with the braid would be oxidation. Braid, normally tinned copper, will eventually oxidize and in some cases form tiny crystals in the weave. The crystal can, and sometimes, do rectify unwanted signals and noise.

The 10 gauge should have a jacket and the ends weather protected if possible. Another option is to purchase coated/jacketed braid (expensive but worth it.

From: michael.dunthorne
Topic: 30769 Message: 30769

I don't know if this is the correct place to put such a request but I am starting to run out of ideas.

I am a Local Authorities Tenant and I am hoping to put up a G5RV or similar wire dipole, however my landlord (the local authority) are refusing to grant me permission until they have received written confirmation, ideally an independent engineers report, stating that the physical structure of a wire antenna will not cause Television Interference.

I do not expect anyone to state that whilst on transmit this will be the case due to all the contributing factors involved.

What I am asking, well actually begging is that anyone who is licensed, to email me direct to state that a piece of wire that hangs in the air cannot cause TVI.

I would be extremely grateful for anyone/everyone assistance.

Thank you for your time and I look forward to hearing from you soon.

Mick:

I'll bite on this one as a Ham operator for 40+ years and as an FCC licensed first class communications engineer and state unequivocally that "a piece of wire that hangs in the air cannot cause TVI", that is in and off itself. There are basically three ways in which you would potentially have TVI from such an antenna.

The first is if there are any issues with construction that resulted in marginal connections or partial contact with other conductors. In that case, it could become a source of TVI due to non-linear mixing at those marginal contact points of transmissions from other nearby transmitters (even when you're not transmitting). Frankly the likelihood of that is extremely low if you do a good job of installing it.

The second, which is not due to the antenna itself but due to your operations close to other consumer electronics, is that your equipment that is connected to the antenna may generate low-level spurious emissions that could cause interference to the nearby consumer electronics. This may happen even if your equipment is fully within specification and it depends on laws in your country and community as to whether you may be responsible for this interference.

The third is that much consumer electronics are not designed to be operated in proximity to transmitters and may simply not be able to handle the signals they receive without creating the interfering signals internally or simply overloading. Again, it may depend on the laws and regulations that affect you as to whether you are responsible or if you may be subject to "quiet hours".

This all brings up the question as to whether it's better for you to have an external antenna of some sort or be forced to use some antenna configuration within your unit. My opinion is that it's clearly better to have the antenna farther away from other tenants and their electronics and any of their TV and radio antennas. In this respect, a properly placed, oriented, and installed wire antenna on the roof or otherwise outside and way from the building may actually minimize the problems relative to you putting something like a "slinky dipole" on a wall inside.

I hope this helps. You may want to solicit assistance from a local radio club who would be more familiar with your area, but in general the above information should be helpful.

Mick ,
Getting the idea across to us here should leave out the appearance of officials , Local Authorities Tenant , just say landlord , unless its one of the , I forget the term , but where someone owns the inside of the building and the community has control of the outside .
You should pick up a copy of the FCC rules book and if you have any of you study guides that you used to pass your test , for several reasons , 1st is to approach the subject from the correct perspective , the technical / Ham perspective , not the uniformed general public's point of view .
Starting from there perspective is loosing up front .
But if you are just a renter , you may not have any options on your side , but to teach the owner some of what should be learned in the ham study materials , basically that the fed's / FCC says that if you station is properly set up , you are not responsible for substandard equipment that other may own .
Now for the suggestions , trying to get the landlord to understand , and you to cooperate with anyone who's chineez equipment may pickup RF from your station , in that same material it suggests this also .
Not owning the property is a big disadvantage for any permanent alterations to property , but through cooperation you may work something out .
There are just a few authorities / rule makers when it comes to antennas , again like the study materials say FCC , airport , radio astronomy and something about historical stuff .
But getting someone or entity to see that can be a court battle .
So working these issues out with whoever , by you teaching them is usually the best way .

Nothing in,nothing out..NO
Was in TN a few years ago, talked the motel manager into putting a 2 meter ground plain on the roof. Biggest 2m penning I have ever heard that night. It screwed up tv reception something awful that night. Down came antenna !!!!

>I don't know if this is the correct place to put such a request but I am starting to run out of ideas.
>
>I am a Local Authorities Tenant and I am hoping to put up a G5RV or similar wire dipole, however my landlord (the local authority) are refusing to grant me permission until they have received written confirmation, ideally an independent engineers report, stating that the physical structure of a wire antenna will not cause Television Interference.

Hello Mick,

A few months ago, I put up a 20 Meter diploe, with a 1:1 Balun (supposed to reduce or eliminate RFI along the feedline (coax)), running 100 foot of RG8X coax. I have AT&T Uverse which was primarily standard TV coax runs externally around my house. I was experiencing RFI. I removed all of the TV (external) coax as Uverse supports Cat 5 (Network Cabling, twisted pair). I replaced all of the coax runs with Cat 5 cable. This eliminated my RFI. I run 100 watts max on my FT-897.

There are a couple of things to consider:

(1) The antenna distance from the (a) shack, and (b) other residents (if not in the same dwelling). Height above the ground 25 feet at a minimum. 35 feet + ideal. Further away from the dwelling (house) the better. Try to get the antenna length as resonant as possible. If you are using a multi band configuration, use a good quality tuner. I like the LDG tuners. Reasonably priced, and they work really well. A goal also is to get the SWR as low as possible 1.5:1 maximum. 1.1:1 ideal, somewhere in between also good. I have the LDG FTL / FT meter (smaller version cheaper) which helped me greatly. The built in meter on the FT-897 is visually challenged. If it barely registers, you are in good shape. The FTL meter is awesome!

(2) Distance from Metal Objects (ie metal gutters). In my case the RG8X coax was running close to a metal gutter and that was also near the outside run of the TV coax (acted like an antenna) to one of the bedrooms. Using RG213 or other high quality coax will also help.

(3) Check the FCC regulations. From what I understand it is up to the Electronic Device Manufacturer to insure proper shielding of their devices. There are also Ferrite rings that your can add via winding your cable around them that may reduce or eliminate RFI. You can add the ferrite rings to the TV side as well. You have options. Many articles on RFI on the internet.

The best thing to do is TEST. Hang the antenna and run some tests. Start with reduced power (25 watts) and gradually work up to full power.

Involve your neighbors, tenants, landlord, and give them your phone number. My antenna is hung between two trees, a good distance apart. So I can move the antenna position by loosening one end and tightening another. The only limitation is the coax feed, as it goes basically from the ground up. I can't move my antenna too far, as the center feedpoint changes and the coax will be become an obstacle. (XYL not happy)

Take some time and do some research. There are many options available.

The first message bounced, hopefully it won't deliver two messages. My apologies if it does.

Take care!

73, Barry

From: Clark
Topic: 30748 Message: 30775

Hi Barry - I'll get back to you later today, I'll go check. I recommend that you hook your 897 up to a dummy load, have another receiver and closed / over the ear headphones, and listen to your own voice to set the controls for maximum punch without distortion. I also noted, that for my voice, the stock mike was not the best, I got the remote mike and it has a better element (maybe I should go to Radio Shack and choose a couple of cheap elements to try out for the old mike, it might make it work better for my voice.)

On my 817 I use an in-line AF processor (built from a kit) and it works about the same, to my ear, the cleaner sound comes from the remote mike that is sold for the 897.

One more opinion - I know you ask if you can live without the extra IF filter, my answer is no. However, if you have the mechanical filter in place and kick the DSP CW filter in-line the selectivity is superb! Really fine. Only very strong signals nearby will bother you with both in place (like a good antenna on a 160 meter contest evening, then all bets are off!)

I recommend you try to get the IF filter and enjoy the fine results.

Just an aside: The empirical evidence certainly appears to suggest
that the "last mile" distribution mechanism (twisted pair) that AT&T
typically uses in its U-verse product is quite susceptible to RFI.
I've yet to find a ham who has installed U-verse without having ensuing
RFI problems at some point, and I know of one case where, when the AT&T
installer has found out that a ham is in the neighborhood, they told
the prospective client that the installation would not work at their
locale, and declined to install it. I'd advise all hams to avoid this
offering.

YMMV,
Rob / KD8WK

Hi Alan - I knew that there were some Tone mikes offered but didn't know any were remote capable. I have the MH-59 (chosen for its remote capabilities of keypad frequency entry!)

I checked my settings on the processor, I have the SSB audio level set to 60 and the processor set to 40. It seems to give me a bit more punch than normal. I will probably check with a station far away to do an A/B test at that level this weekend (I only checked in my own headphones with another receiver to hear the difference.)

Do be careful when setting it up and get some honest reports. I have heard many stations turning up the gain on the mike and the processors to the point that they were unintelligible, but they thought they were increasing readability. Get it well under distortion and the punch will matter, hi.

Gday

95% of reported TVI events are caused by defective receiving apparatus, not ham radio transmitters or antennas.

"Receiving apparatus" covers a multitude of electronic Gizmos, most of it poorly designed or serviced junk.

Hello all.

I recently aquired a ft-897, and i have some doubts:

1 - How to identify if it is a 897 or a 897D ?

2 - It can be possible in any way to do a type of freeband on it that can be easy reversible ?? (like a switch or something)

3 - The reception on vhf sometimes dont give-me a signal, just an audio. (like ppl in other cities around me) The signals on my city are displayed fine (ex. A friend on my city comes on S8, the other comes with s0 but audio good, the same on tm-v7a comes S8, S4..) Maybe a configuration o Second menu??

The serial of the radio starts at 8D, so its a 2008 April.

Tnx in Advance

73

PU2XRD - Rodrigo

From: Carl Wulfestieg
Topic: 30785 Message: 30786

Rodrigo-
If the Serial Number is "8" that means 2008 (2008 FT-897's are "D")

If the 2nd Serial Number character is "D" that means it was made in February (January is "C")

Question 2: As far as I know, "freeband" can only be done with a modification of the "jumpers"

Question 3: I don't think so but someone else will have to help you on this one - but my advice would be to be very careful before you attempt "2nd menu" changes

Rodrigo,

As far as the meter, I recommend getting the LDG Electronics FT or FTL. It is awesome as far as measuring signal strength, SWR, etc. The built-in FT-897 meter is visually challenged.

Ben-
The FT-897 D has the "TCXO-9 Temperature Compensated Crystal Oscillator Unit" as standard equipment.
The FT-897 D has the five 60 Meter channel frequencies pre-programmed into memory.

Danny- Yeah, it's a dumb question! No, I'm just kidding (LOL) - initially, I couldn't find mine either, I called Yaesu - and many others are in the same situation.

It's on a white label, on the side opposite the "handle", toward the rear. It's just above the bottom bar code after the words "Ser. No." I need a magnifying glass to see mine. That's why it's hard to see.

The first number is the year built- "3" means 2003. Since we're in 2010, will that number be "10" or "0"? I don't know but I would guess for a "0".

Next is a letter for the month built - "C" means January, then "D" for February and . . . . then "M" for November, and "N" for December.

The next two numbers are the "Lot Number".

Then, the next four numbers are the "Unit Number".

Subject: Re: [FT897] a few questions.

Rodrigo-
If the Serial Number is "8" that means 2008 (2008 FT-897's are "D")

If the 2nd Serial Number character is "D" that means it was made in February
(January is "C")

Question 2: As far as I know, "freeband" can only be done with a modification of

the "jumpers"

Question 3: I don't think so but someone else will have to help you on this one
- but my advice would be to be very careful before you attempt "2nd menu"
changes

To: <FT897@yahoogroups.com>

Danny- Yeah, it's a dumb question! No, I'm just kidding (LOL) - initially, I couldn't find mine either, I called Yaesu - and many others are in the same situation.

It's on a white label, on the side opposite the "handle", toward the rear. It's just above the bottom bar code after the words "Ser. No." I need a magnifying glass to see mine. That's why it's hard to see.

The first number is the year built- "3" means 2003. Since we're in 2010, will that number be "10" or "0"? I don't know but I would guess for a "0".

Next is a letter for the month built - "C" means January, then "D" for February and . . . . then "M" for November, and "N" for December.

The next two numbers are the "Lot Number".

Then, the next four numbers are the "Unit Number".

Clark,

I did misunderstand what you meant by remote mike. I have the MH-59 as well although I don't always use it. Is it your opinion that the MH-59 has a better sound quality than the mike that comes with the FT-897? I don't always need the capability so I had been swapping them. Maybe I shouldn't.

Subject: [FT897] Re: Anybody using the Speech Processor?

Hi Alan - I knew that there were some Tone mikes offered but didn't know any were remote capable. I have the MH-59 (chosen for its remote capabilities of keypad frequency entry!)

I checked my settings on the processor, I have the SSB audio level set to 60 and the processor set to 40. It seems to give me a bit more punch than normal. I will probably check with a station far away to do an A/B test at that level this weekend (I only checked in my own headphones with another receiver to hear the difference.)

Do be careful when setting it up and get some honest reports. I have heard many stations turning up the gain on the mike and the processors to the point that they were unintelligible, but they thought they were increasing readability. Get it well under distortion and the punch will matter, hi.

A few weeks ago I also purchased a 2nd hand FT-897D (together with the MFJ-993B Intellituner). I have not really had time to check all features as reading all these mails also take time (but I appreciate them!). I can understand that for the factory it is too expensive to add the "D" on the front plate, but I do not understand why Yaesu have not printed the complete designation FT-897D on the label at the left side.

I also miss an engineering change history table. All I have found out is that the D-version has the TCXO factory installed. Without the D, the TCXO is an option (extra cost). When you report about problems I have no idea if any of these are factory fixed in my rig which is relatively new (serial no. 8J....).

My next project is to find out if my "Intellituner" really is intelligent....and if Yes.... why it is necessary with 52 pages of Instruction Manual. This scared me so I connected my old Heathkit SA-2040. I found that adjusting with the bar indicator was good enough but I have also added the LDG meter on the wish list.

Hi Alan - For my voice and my settings, the MH-59 gives more highs and increases the intelligibility a bit. I have a low voice. The stock mikes have more lows and work just fine, but in a tough situation, several stations have said the MH-59 helps a little.

Give them each a listen in some headphones if you can, I suspect your particular voice will tell the tale.

When I'm out with my 817 using internal batteries (2.5 watts out) and a simple in-line processor, the MH-59 is the preferred mike for me. For everyday use with the 897 at 100 watts, it is less important, though most stations I've asked do prefer the sound of the MH-59.

If you have the original shipping container it will be marked as a "D" on the white label.

With lot 68 and above the Roofing Filter, XF1001, was changed from a 2 pole to a 4 pole.

All the "D" types that I have had in the shop had the 4 pole filter installed. I have never

seen a 2 pole filter in a "D" tape.

I think it is safe to say if you have the 4 pole filter you have a "D"

The 2 pole filter is marked MF68 G. The 4 pole is marked MFT68 Q. They are not always

marked with all the letters but the G and the Q are easy to spot.

The filter is located on the MAIN UNIT which is on the top. On the right are two shield

covers. The filter is just to the left of the covers, in line with the gap between the two.

The USA version is easy to tell because according to the Yaesu web site, "The new FT-897D version includes coverage of the U.S. 60-meter (5 MHz) band, along with the 0.5 ppm TCXO Unit, at no additional charge!" I might have told someone 6 meters before but meant 60. Was replying from my phone and think I missed the 0."

You might check for any Yaesu promotional or advertising literature for the FT-897D for the country for which it was made to see if there are any easily recognizable features such as with the 60 meter band for the USA version of the D..

No, that's not the case. The 897 had 6, 2 and 440 just like the D. The difference is very slight, the TCXO installed in the D model (added to the D it cost extra) and auto coverage of 60 meters in the D model (easily added in the non D model). I don't know of any other real difference at all. Probably a few little circuit changes but the specs remain the same.

Thank you for the reply.
I have just been going over what schematics I can find for the interface and the CAT port, and it looks like it is a 5v control line through out.
BUT.... What would be missing is the ability for the ATU to tell the radio to stop TX'ing once a adequate tune condition is reached.
Oh well. I will just carry on doing as you have indicated, and use the whistle method to initiate the tune cycle.

Many thanks

Rob,

The TCXO stands for "Temperature Compensated Crystal Oscillator".
The crystal is designed so that it is even more temperature stable than a standard crystal oscillator.
It dosen't draw any aditional power.

Marc DAVID

you HAVE TO BE KIDDING !!!

not is this lifetime no chance :)

if his antennae were disconnected, it definately wont be atmospheric !!!

apart from the fact that if you have ever heard solar flare noise on HF and 6M
you know it sounds more a smoother buildup of hiss, then a slow decline over
a short period of time... minutes to 10's of minutes depending on the size
of the
flare.

I have heard of 455kc filter problems similar to those suffered by the Kenwood
TS2000 that produces the same symptoms. There were a whole batch of these
faulty ceramic filters, that many TS2000 owners are now having to get
replaced.
The radio operated great for the first few years, then the probs started
showing up

cheers
Dave

30816. WIDEBAND mod - a little confused :S

Yahoo group: FT897 (2010)
Date: 2010-08-09 11:28:50 UTC
From: Rodrigo
Topic: 30816 Message: 30816

Here i am again..

Well ppl, i appreciate that u guys answer me so damm fast, and the information is a good reference for me.

I did a search on google bout the mars/cap mod on hardware, but i found ones that use one set of on/off jumpers and other that uses another.

So lets the facts:

My 897 is definitly a D one, so ft-897D, maded in 2008.
On the label i got "Made in JAPAN", so its japanese?? I see that has uk, us, and other sorts of version.

But the really doubt is: Some told to jump 1006 diode, some told to open 1006.

It inform that 1006 jumped, give me 60 meters on 897d, other told me to open it.

What is the correct mod to do ?

30817. Static Noise after transmission on 40m

Yahoo group: FT897 (2010)
Date: 2010-08-10 00:21:00 UTC
From: Chuck Stroud
Topic: 30816 Message: 30817

Hi to all-
I have noticed that whenever I tune up my radio I get an increase in static crash noise on 40m. I have not noticed in on other bands yet, but it jumps from minimal to about s6-s7. It goes away after 10-15 minutes, but comes back immediately when I transmit. Any thoughts?
73,
chuck
ka8hde

30819. 60 Meter question

Yahoo group: FT897 (2010)
Date: 2010-08-10 18:22:30 UTC
From: Danny Loyd
Topic: 30819 Message: 30819

If your FT-897 shows a TX ERROR when you try to tune up the 60 meters frequencies, is this an indicator that the unit is a non-D? If so, how do you modify it to work on the 60 meter frequencies?

Thanks in advance,

Danny

From: DALE
Topic: 30819 Message: 30820

You are not allowed to tune up on 60 meters. SSB only, no CW.
One should read the rules .
A non D model will not tune as it is out of band.
A D model will not tune as it is programed not to. The proper frequencies are programed into 60 meter channels
Dale

Hi Danny -

You can go over to the files section and find several of the mod sheets that explain how to open up the TX for the 817/857/897. Carefully check the rules on 60 meter operation, it is channelized and you must be on the correct frequency (it is NOT simply "dial in" the frequency and talk.... you may need to calculate what your center frequency actually is on a given rig). And you must be right on the channel, so the TCXO could be important to keep you stable (that's the main difference with the 897D anyway....).

We had a very long thread on this topic in this group, starting on 2005-06-30; I contacted and received an opinion on the matter from the FCC's legal counsel Riley Hollingsworth, which was posted in that thread.

Briefly, you can tune up on 60m, but you have to be careful how you do it. Eg, the tuning emissions must be in the middle of the channel, and not at the SSB suppressed carrier frequency !

Okay, I need to clarify my question. I put the FT-897 on the designated tuning frequency according to the ARRL Band plan chart I have and I get a TX ERROR indicator on my radio. Does this mean that my radio is not set for the 60 meter channels??

Thank you,

Danny

You need to go to the radio's memory section (press "V/M") and try to select memories 601 through 605 (go to memory 001 and turn the "Mem/VFO CH" knob to the left). If you can, the unit has the channels, and that's what you must use, not manually tuning the radio. If you have the USA FT-897D manual (if not, you can download it from the Yaesu web site), that's documented on page 23.

30825. Re: Radio - ATU interface

Yahoo group: FT897 (2010)
Date: 2010-08-10 22:49:36 UTC
From: iz0inx
Topic: 30693 Message: 30825

No problem Jase, with my interface, when the tuning process ends, the FT-897 automatically goes back to Rx.
The following is the schematics of this interface, it is realized with FidoCAD.
If you don't know it, you can download it from:
http://www.enetsystems.com/~lorenzo/fidocad_win.asp

After the installation, just copy the following text and paste it into a simple text file.
Then rename it as whatever.fcd
At this point it could be opened with FidoCAD

cheers,
Fil IZ0INX

Just to say that in the post the text became wrong formatted.

So, after pasted it into a text file, please remove the <CR>/<LF> at the end of the three long text lines.
In other words: each "TY" line should have the text in the same line, no wrap, otherwise an error will occur.

Fil IZ0INX

You need to go to the radio's memory section (press "V/M") and try to
select memories 601 through 605 (go to memory 001 and turn the "Mem/VFO
CH" knob to the left). If you can, the unit has the channels, and
that's what you must use, not manually tuning the radio. If you have
the USA FT-897D manual (if not, you can download it from the Yaesu web
site), that's documented on page 23.

No body on 60 M anyway.
You can software wide band it and program the PROPER frequencies into the memories.

I did that with mine so I could get on 60 M when it became available.
I have a better radio for that now. I cannot get my 817 to revert back to normal now.

30830. New model soon

Yahoo group: FT897 (2010)
Date: 2010-08-09 18:38:21 UTC
From: nickcarr3151
Topic: 30830 Message: 30830

Hi Guys --

For some time now, I've been debating on picking up the 897D for a portable rig so I can take hiking, camping, etc. I owned the 817ND for a short time but I sold it. Overall it was a neat little radio, but I couldn't get use to the 5w output. Granted, I was shocked with how much 5w would do (with a proper antenna system) but I was wanting more.

I've held off buying the 897 recently because I'm thinking Yaesu (or perhaps Icom) may be thinking of releasing a new model next year.

Is the 897D worth buying now, or should I wait until next year? Has there been any rumors of a new model?

I'm not sure how much use I would get for the remaining year (as I've used up vacation time) so I'm not in any real hurry to buy right now.

Thanks
-Nick

Danny,

The best way to check is to follow the
intructions on page 23 of the FT-897D operation manual titled:

OPERATION ON 5 MHZ BAND
(U.S. VERSION ONLY)

If you do not have the memory entries mentioned there, you probably don't have a D model.

30832. Re: Radio - ATU interface

Yahoo group: FT897 (2010)
Date: 2010-08-09 06:47:53 UTC
From: colin.bell99
Topic: 30693 Message: 30832

Jase,

I am not an MFJ-993 owner but.... I had a good look at buying one....

I would be looking at the remote interface and design a small box to trigger the MFJ to tune (say a one second pulse) and have another line that connects to the ACC jack on the FT897D to set/unset the FT897d into transmit mode.

In Fils reply I would expect the action of the Tuner in detecting a good matching point to automatically switch the FT897 back to RX mode (as the LDG897 and Z100 do).

However the MFJ 993 has an auto mode where the implication is to tune whenever the tuner detects a poor SWR. So if this is the case all you need is to send a continuous CW carrier until the tuner is tuned (or am I missing something?).

You ask why the radio interface? I would imagine it is a serial line (oneway or two way I don't know) that enables, via the different option cables, control of different rigs.

I am currently going through similar problems with an FT450. I supplanted my fixed FT897 with an FT450 and now need to get an LDG Z100 tuner to switch the FT450, as it did the FT897.

Hope this helps.

Bill,

This problem has been reported on this group before.

Seems (as I remember) there maybe a broken ceramic filter.

As you have it with the aerial unplugged it must be in the radio.

The Italian version of the FT-897D (also named FT-897D/I) sports an
SSB COLLINS YF-122S filter as well.

If you don't have M-601 through M-605, you probably don't have an 897D.
I'd suggest two other unlikely possibilities before you resort to a
hardware or software kludge to open the radio up:

1. If you have MEM GROUPs turned on, these memories will be in
Ml-001 through Ml-005 instead.

2. I suppose it is conceivable that someone may have either hidden
or reprogrammed these memory cells. A full software reset should
restore them (I think), if you do indeed have an 897D.

What is your 897's serial number?

Not sure if it is Mod to MARS or not. I bought it second hand on eBay where it was advertised as a D model. Not sure what changes the previous owner made. If it is mod for MARS, this is a good thing as I want to get into Navy MARS and would have to do the modification anyway. How do I tell if it has been modified for MARS?

I know these may sound like dumb questions, but I am just now getting into the technical and electronic part of radio again after along time away from doing any electronic work.

MARS mod
Tune it to any non ham frequency- i.e. 11m. Key the mic if you do not see TX error, then it has the MARS modification

AT897
Remove the four screws on the case and then the four screws on the inside of the unit. These screws go through the circuit board and attaches to the case.

Not sure if it is Mod to MARS or not. I bought it second hand on eBay where it was advertised as a D model. Not sure what changes the previous owner made. If it is mod for MARS, this is a good thing as I want to get into Navy MARS and would have to do the modification anyway. How do I tell if it has been modified for MARS?

I know these may sound like dumb questions, but I am just now getting into the technical and electronic part of radio again after along time away from doing any electronic work.

From: faygopaygo
Topic: 30830 Message: 30841

Nick,

In MHO I would stick to the 817 for anything that would involve hiking or or the need to carry the rig any distance. The 897 is pretty heavy empty and with batteries you're talking 10-12 lb.s, plus it's bulky. Not my idea of a fun hike. If you can't get past the 5W power limit of the 817 I would suggest the 857 with a custom LiPoly or LiFe external battery pack. This would enable full power op.s with half the weight of a 20W limited 897 with internal batteries. Is the difference between 5 and 20W output worth 3 times the weight? Not to me!!! I still don't understand the strategy of marketing a heavy rig with a heavy internal battery pack with a 20W limit as being "portable". My IC-751 has a handle, an internal 110V PSU and weighs 20+ lb.s but I can carry it and plug it into a battery supply or 110V source anywhere I go and operate at 100W. Does that qualify it as "portable". I use my 897 as a base rig and for car camping/FD type op's, that's it. If I'm walking I use something like the 817 and as good an antenna as possible. Best suggestion, stick an extra 8 lb.s (weight difference between 817 loaded and 897 loaded)of water in your pack and take a nice 5-10 mile hike and ask yourself which rig you want? As far as new portable rigs go I haven't heard of anything but that doesn't say much. I like the 857 for it's size/weight to power ratio. If they could put a new tech internal battery with full power capability into it and keep the weight under 6 lb.s then I would consider using it for hiking type op.s.

My .02, hope this helps,

Randy

Overall it was a neat little radio, but I couldn't get use to the 5w output. Granted, I was shocked with how much 5w would do (with a proper antenna system) but I was wanting more.

Graham,

Depends on what you want to do with it. If you want to do any mobile ops at all you want the 857. As far as I'm concerned, for any other use, it's the 857 also, provided you have a computer to run HRD when running the 857 as a base rig. I have an 897 and I like it for the price I paid. If I could do it over again I would go with the 857(cheaper, smaller, lighter, same guts and capabilities). Before HRD I would have said the 897 for base or portable op.s and the 857 for mobile or portable. HRD changes the playing field. You can make your 817 into a base rig if you want! I also think the 857 with a new tech (LiPoly or LiFe) external battery is a far better portable rig than the 897. Granted, you do pay out the wahzoo for those batteries and you need a dedicated charger for them (there is no free lunch!). However, their fantastic power to weight ratio makes them worth it, especially when you see what Yaesu is charging for their old tech batteries and chargers!! (See the A123 site http://www.a123systems.com/ for info on LiFe batteries)

Hope this helps,

Randy

We really enjoy the 897!
Our daughter is house sitting at a place on the ocean in So Portland, Maine, about an hour and a half south of us, so...
We took it out today portable w/a whip antenna up 15 feet using an LDG 897 tuner and had a great time.
We DXd w/Germany, Dominican Republic, Cuba, Greece as well as US stations.
Rig is bigger than the 857 so you don't need a laptop to carry along, personally, I'd stick to the 897.
Back home it was set up in the shack where I mostly use it for digital in about 15 minutes.

Good morning,
If you are wanting the radio for in the car, then get the 857, it has the detatchable front, and is small enough to hide away.
IF you want something that you can take out on portable / field days, then the 897 wins. It is built like a brick sh*t house and will take knocks in its stride. Internal batteries (optional) gives you the portability so you are no longer beholded to a generator or large lead acid battery.
For the home, well, if you are limited for space then either will do the job, both having the same menu and as you are already aware, the same innards. But personally a if space is not a problem, I would opt for a larger radio...

Anyway, just my pennies worth and I hope you find some of it helpful.

BUT not in the same way. I choose the 897 over the 857 because the
controls are larger. And after seeing the 857, I very glad I did. I could
no more have used the 857 than a pig could send code...

You're right, the two radios are very similar, but they are also very
different, too.

Spend the extra pounds on the 897D. It has more options than the 857D. Go to one of the stores and take a look at them. The 857D is very tiny and it is a pain in the neck to work all of the functions. The 897D is very portable and you can use the bolt on power supply and antenna tuner which will make it a breeze to carry with you.

Tried to use my radio out of the Ham bands and got TX ERROR. So I believe that I have a non-D. Works great, but seller shouldn't have advertised as a D if it wasn't. I have no complaints at all about the radio. Next question is how do I expand it for MARS. Is a software expansion or a jumper change? I know this has probably been discussed before, but I am finding out that finding past threads on this group isn't very user friendly especially for me.

Thanks,

Not sure if it is Mod to MARS or not. I bought it second hand on eBay where it was advertised as a D model. Not sure what changes the previous owner made. If it is mod for MARS, this is a good thing as I want to get into Navy MARS and would have to do the modification anyway. How do I tell if it has been modified for MARS?

I know these may sound like dumb questions, but I am just now getting into the technical and electronic part of radio again after along time away from doing any electronic work.

I own both.

I really feel the FT-897D is worth the extra money, as the TXCO is already installed. The display is easier to read as well. Plus the FT-897D has some great options that either mount in the radio (power supply and batteries) or on the radio (ATU). I bought the FT-897D in January 2010 after using a friends while out camping. I really liked it, and wish I had bought one years ago.

I run the FT-857D in my wifes car, where I usually ride as a passenger. Tiny display and tiny buttons are logical there. I have owned the FT-857D since August 2005, with no problems.

BUT not in the same way. I choose the 897 over the 857 because the
controls are larger. And after seeing the 857, I very glad I did. I could
no more have used the 857 than a pig could send code...

You're right, the two radios are very similar, but they are also very
different, too.

Topic: 30842 Message: 30854

However....

If you wish to install the radio in your vehicle, you will find the FT-897D is too big. I traded my 897 for an 857 for that reason. The FT-857D has a detachable faceplate so it can be installed remotely. As with the 897, the readout is tiny, but easily corrected with an LDG 897 meter.

The on-board battery capability of the 897 seems nice at first, but....your power is automatically reduced to 20W out and it makes the radio extremely heavy..no fun carrying it any great distance....Now, I pack my A-123 batteries in and can run my 857 all day on a primary and 1 backup set. Contemplating a nice set of solar cells to recharge the batteries during periods of non-usage. Unfortunately, the Harbor Freight cells just aren't big enough.....

The two radios are now identical, electronically, so the big choice for me was portability vs. installibility. I opted for installibility, obviously. But I had to have the 897 first to be able to make that choice.

A word of caution, the FC-30 tuner is garbage. Extremely high failure rate. The LDG tuner is much, MUCH better.

In any case, have fun choosing....good radio, no matter which you pick.

That is no indication of whether your radio id a'D' or not. All models will do this unless widebanded.

Have a look in the files section of this group under 'Mods' and you will fing the Yaesu sheet that describes what the jumpers do. That will help you select the correct links.

THe serial no will settle the matter of whether it is a D or not.

30860. Re: what is best

Yahoo group: FT897 (2010)
Date: 2010-08-12 15:53:27 UTC
From: harry l
Topic: 30842 Message: 30860

My .02 cents worth...

I have owned the 817, 857D and now the 897D. In fact I have had (4) 817's starting right after the first came out and will probably pick up another used one someday in the near future. That being said let me give you my impressions and thoughts.

The FT-817 is a great do most all portable QRP rig. The radio does need filters to make it better at least on CW, but even without it the radio is nothing sort of amazing. On the negative side the controls are small so if you have fat fingers and/or bad eyesight this could be a problem. The internal battery is nice for short QSO's. If you are doing a day thing you will need an external battery pack. Other then that I have found the radio to be a fun radio.

The FT-857D has been a bad radio for me. Have had two. Both failed. Both went back to be repaired by Yeasu. Both are gone now. It was replace with a IC-706MKII and quite frankly the 706 was a hell of a lot easier to use, had a better receiver and you for mobile was better all around. What caused me grief was the finals blowing. A common problem I found out later. The radio is really the FT-897 crammed into a smaller package, thus harder to get rid of the heat. So I am not pleased with my 857D experience and can not and will not recommend it to anyone. Others will..but I can't.

The FT-897D I got used with the LDG-987 ATU and both filters. It also had the internal battery pack. I got rid of that in trade for the fancy do all mic. I then got the FB-20 internal PS. Now I have a do all rig that can plug into any wall socket and run, or I can pull the connector loose and use the radio mobile or with battery pack. To me this configuration makes the radio ideal for most anything at anytime. The only negative I have is the CAT port is not a great design. No matter which control program I use the stupid thing drops out randomly. I did finally get the radio to work with FTBasicMM...a must software to get. So that is all I use the port for. Preloading the memories.

So my first choice is the FT-897. The second is the FT-817 and probably get a used one anyway just to have it to play with. The 857 I would not get another for any reason.

Hope that helps

To: FT897@yahoogroups.com
Subject: Re: [FT897] 60 Meter question

Tried to use my radio out of the Ham bands and got TX ERROR. So I believe that I have a non-D. Works great, but seller shouldn't have advertised as a D if it wasn't. I have no complaints at all about the radio. Next question is how do I expand it for MARS. Is a software expansion or a jumper change? I know this has probably been discussed before, but I am finding out that finding past threads on this group isn't very user friendly especially for me.

Thanks,

Danny

MARS mod
Tune it to any non ham frequency- i.e. 11m. Key the mic if you do not see TX error, then it has the MARS modification

AT897
Remove the four screws on the case and then the four screws on the inside of the unit. These screws go through the circuit board and attaches to the

case.

Subject: Re: [FT897] 60 Meter question

Not sure if it is Mod to MARS or not. I bought it second hand on eBay where it was advertised as a D model. Not sure what changes the previous owner made. If it is mod for MARS, this is a good thing as I want to get into Navy MARS and would have to do the modification anyway. How do I tell if it has been modified for MARS?

I know these may sound like dumb questions, but I am just now getting into the technical and electronic part of radio again after along time away from doing any electronic work.

Danny

Danny:

Your FT897D is mod to MARS ? If you do this mod, you lost M601 through M605 memories.

Topic: 30819 Message: 30864

My FT-897 have serial number 7Lxxxxxx and not any reference "D" leter in white label.
Made 2007, I think.

FT-897 in 2007 is not model D ?

I think "D" model is:
- DSP is not option, is factory default.
- TCXO-9 is not option, is factory default
- 60m channels in memories M601 to M605 (lost this memories and lost 144/430 ARS feature (menu 001 and menu 002) if MARS mod is made in your unit, is a colateral efect of MARS mod)

That is all or any other difference ?

Mine is a "7I" (built a few months before yours) and it is a D.

My .02 cents worth. I'm a relatively new ham. When I was deciding which radio to buy I narrowed it down to the 897 and 857. HRO was having a customer appreciation day and I talked to several people who own both. I ask them if they could keep only one the 857 or the 897 which would they choose. To a man they all chose the FT-897. So I went with it. I think it is a fine radio. It is my first.

> The FT-817 is a great do most all portable QRP rig. The radio does need filters to make it better at least on CW, but even without it the radio is nothing sort of amazing. On the negative side the controls are small so if you have fat fingers and/or bad eyesight this could be a problem. The internal battery is nice for short QSO's. If you are doing a day thing you will need an external battery pack. Other then that I have found the radio to be a fun radio.
>
> The FT-857D has been a bad radio for me. Have had two. Both failed. Both went back to be repaired by Yeasu. Both are gone now. It was replace with a IC-706MKII and quite frankly the 706 was a hell of a lot easier to use, had a better receiver and you for mobile was better all around. What caused me grief was the finals blowing. A common problem I found out later. The radio is really the FT-897 crammed into a smaller package, thus harder to get rid of the heat. So I am not pleased with my 857D experience and can not and will not recommend it to anyone. Others will..but I can't.
>
> The FT-897D I got used with the LDG-987 ATU and both filters. It also had the internal battery pack. I got rid of that in trade for the fancy do all mic. I then got the FB-20 internal PS. Now I have a do all rig that can plug into any wall socket and run, or I can pull the connector loose and use the radio mobile or with battery pack. To me this configuration makes the radio ideal for most anything at anytime. The only negative I have is the CAT port is not a great design. No matter which control program I use the stupid thing drops out randomly. I did finally get the radio to work with FTBasicMM...a must software to get. So that is all I use the port for. Preloading the memories.
>

Subject: [FT897] Re: what is best

My .02 cents worth...

I have owned the 817, 857D and now the 897D. In fact I have had (4) 817's starting right after the first came out and will probably pick up another used one someday in the near future. That being said let me give you my impressions and thoughts.

The FT-817 is a great do most all portable QRP rig. The radio does need filters to make it better at least on CW, but even without it the radio is nothing sort of amazing. On the negative side the controls are small so if you have fat fingers and/or bad eyesight this could be a problem. The internal battery is nice for short QSO's. If you are doing a day thing you will need an external battery pack. Other then that I have found the radio to be a fun radio.

The FT-857D has been a bad radio for me. Have had two. Both failed. Both went back to be repaired by Yeasu. Both are gone now. It was replace with a IC-706MKII and quite frankly the 706 was a hell of a lot easier to use, had a better receiver and you for mobile was better all around. What caused me grief was the finals blowing. A common problem I found out later. The radio is really the FT-897 crammed into a smaller package, thus harder to get rid of the heat. So I am not pleased with my 857D experience and can not and will not recommend it to anyone. Others will..but I can't.

The FT-897D I got used with the LDG-987 ATU and both filters. It also had the internal battery pack. I got rid of that in trade for the fancy do all mic. I then got the FB-20 internal PS. Now I have a do all rig that can plug into any wall socket and run, or I can pull the connector loose and use the radio mobile or with battery pack. To me this configuration makes the radio ideal for most anything at anytime. The only negative I have is the CAT port is not a great design. No matter which control program I use the stupid thing drops out randomly. I did finally get the radio to work with FTBasicMM...a must software to get. So that is all I use the port for. Preloading the memories.

So my first choice is the FT-897. The second is the FT-817 and probably get a used one anyway just to have it to play with. The 857 I would not get another

for any reason.

Hope that helps

I like what a lot of people are saying, it depends on what you want to do with it. Unless you have a big vehicle, the 897 is going to eat up a lot of space. For the shack, mine has been a dream.

I have the 897D in my shack. I bought the FP-30 internal power supply, and the LDG AT-897 tuner. A bunch of local hams talked me out of the FC-30 tuner, and I'm glad they did. The AT-897 will tune an SWR up to 10:1, whereas the FC-30 will only tune upwards of a 3:1. As I am running a compromised attic dipole, I needed all of the help I could get.

I also added the MD-100A8X desk mic, and I get excellent audio reports. One note of warning, if you get this mic, make sure you turn the built-in filter off. I had it on and was getting horrible reports. I almost sent it in to Yaesu, and then I read a small notice on the paper that came with it (maybe I should have read it first). It stated certain radios had to have the switch off, and the 897 is one of those. I flipped it off and now I get great reports.

As I mentioned earlier, I have a compromise antenna, a 19' dipole in the attic. With my setup, I make contacts all over the world when the bands treat me right. I have hit Aruba, Curacao, Italy, Germany, and many states, all with 50 watts. I keep the power down because I am in an adjoined townhouse.

I think the 897 is a great rig, just remember what it is. It is a rig with HF / WARC, VHF, UHF, DSP, built-in TXCO, and many other features for less than $800.00. Don't compare the audio with a TS-2000 or an Elecraft K3.

73,

Hank / KB4MTO

From: ke5dfr@sbcglobal.net
Topic: 30842 Message: 30869

I have had both an 857 and the 897D. I originally had the 897D in my truck with an ATAS120 antenna and it worked great. I moved it inside to work digital and bought an 857 for the truck. I have since sold the 897d and bought an FT950 for the shack.

For the money and ease of use, the 897D is the way to go. HRD makes using the 857 a bit easier though. Still I liked the 897D better and wish I had kept it and sold the 857.

30870. FW: Probably slightly OT - earthing, and lots of RF in the earth system??

Yahoo group: FT897 (2010)
Date: 2010-08-13 13:22:30 UTC
From: Damien Gardner Jnr
Topic: 30870 Message: 30870

Hi Folks,

Apologies if this is slightly OT, but I'm not really sure where else to ask..

Ever since I moved my ham gear in from the shed (10'x30' aluminium shed) to the garage (brick, so no awesome shielding like the shed had..), I've basically not been able to key up my 897, if I wanted to keep using the USB devices on my desktop.. Or for that matter, if I didn't want the desktop to reboot!

I've spent today re-arranging everything - desktop is back in a solid steel 4RU rackmount case in my server rack, I have an 'earth bus' under the workbench, with basically everything in the shed tied to it. And while my rebooting problem is gone, my disappearing USB devices problem still remains..

Having just fired up the cro, and done some digging, I'm really quite confused! It was bad enough at first, when the USB cable coming across the room from the PC came up with no RF showing, then plugging in a USB hub (non-powered, no devices on it), and having 10Vp-p of a nice clean 7mhz sinewave appearing between the shield of the USB ports on the hub, and the earth rail under the workbench..

What makes me even more confused, is that if I shove the cro between the earth bus, and the earthing terminal on the back of the 897 (which has just under a metre of cable between it and the bus!), I see 26Vp-p sinewave at 7MHz!

Honestly, I'm completely stumped! I'm SURE that I simply shouldn't be seeing this - right?? Or should I?

For a little more background on the earthing in here.. - I have 2m long ground stakes hammered into the ground at the front and back of the garage.. - then 2 runs of 7x7 cable (the stuff I use for my rigging..) running between the two stakes, and tied to a 12" long length of steel, under the workbench.. I've drilled and tapped M4 threads every inch along the bar, and have run cable with crimp-on eye lugs (you know the ones you use for automotive-ey stuff? Basically the right size of things like the -ve output of my PSU's, computer case screws, and M4 bolts) on each end, between an M4 bolt into the steel bar, and each piece of equipment. And then also connected this bus to the mains earth in the garage for good measure. Although technically this was done as soon as I ran the 4 guage cable from the bar to the server rack, which houses the two 3KVA UPS's, as they run all earth pins in/out to the case, and hence the rack rails/frame..

Any thoughts? Am I just going mad, and this is all normal? Or am I seeing something seriously messed up??

Thanks for any ideas - I'm totally lost! (and my lifelong mentor is away on a couple of month's holiday through the deserts!

Cheers,

Damien

Damien-
As I follow your explanation it is first from "2M long ground stakes" in the Earth.
at Garage front and back.
Then to "2 runs of 7X7 cable" between the stakes. Then to "12 inch length of steel bar".
Every piece of equipment is then connected to the steel bar (bus).
It sounds OK up to this point.
But then you "connected this bus to the mains Earth in the garage".
It sounds like you now have two separate paths to "Earth" from the bus?
Is it possible you now have a "loop"?
Could this be a factor in your problem?
Another point - how long are the "2 runs of 7X7 cable"? Front to back of garage might be 20 feet?
I know that ground runs are supposed to be as short as possible. Maybe you should just run the cable from the bus to the closest ground stake?
I am not sure that either "loop" or "long ground run" are causing your problem? Could RF be getting picked up by this loop? These are some ideas - I hope this helps eliminate your problem.

From: Craig
Topic: 30819 Message: 30873

There is yet another possibility. Soft Jump worked on early 857Ds and 897Ds. It would blow out the 600 series memories just like the hardware mod. Using Soft Jump to restore the radio to factory specs and doing a hardware reset would not restore 60M. But it would restore repeater offsets and band restrictions.
Look for Soft Jump if you want to try the software method. If it does the MARS mod, that does not rule out that it is 897D.
There were no major hardware changes between the D and non-D other than the TCXO was free.

30874. FT-897 and SignaLink USB

Yahoo group: FT897 (2010)
Date: 2010-08-13 20:55:23 UTC
From: Rob Stampfli
Topic: 30874 Message: 30874

I recently acquired a SignaLink USB box to play with in conjunction with my FT-897D. It seems like the 897 is very well suited for operating the digital modes, and this seemed a good way to go. In general, the configuration works well, but I do have a few questions for SignaLink or other knowledgeable users:

For those unfamiliar with the SignaLink box, it connects between a USB port on the computer and the data port on the 897. The box contains a sound card that has been tuned for ham radio applications. It also provides electrical isolation. The box takes receive audio from the 897 and allows it to be imported into the computer. It also takes digitally generated audio signals from the computer, and injects them into the 897 for xmit. (And, finally, it has PTT control.)

The interface controlling the sound card on the xmit side is straightforward, with the normal Master and Wave volume controls for setting output levels into the 897. There is also a pot on the SignaLink box itself for fine tuning the level.

The receive side has fewer controls: There is apparently no way for the computer to control the gain on the SignaLink's sound card directly. There is only a pot on the unit itself which does this. Further, the data port on the 897 provides a fixed-level output, which the manual claims is 100 mV into a 600 ohm load.

My questions:

1. By default, the audio level from the SignaLink into the computer is fairly low. It seems to be adequate for decoding PSK signals, but it barely registers on the bar graph of the audio control on the computer, even with the pot on the SignaLink turned to full volume. However, I'd like to also use this box for recording sample SSB transmissions. This works -- dare I say even works well -- except for the fact that the resulting audio files have very low audio.

Has anyone else tried doing this? If so, is the low signal level into the computer typical of what you see, or is it peculiar to my setup?

2. Frankly, the 100 mV output from the 897 seems low. What *is* the appropriate audio level into a sound card? I see the SignaLink claims it provides 200-300 mV to the xcvr. I like the fact that the level of the 897 is independent of the setting of the volume control, but is there a way to tweak it into providing a higher fixed level output on its data port?

3. There is a saving grace: The SignaLink has an internal jumper which increases its RCV sensitivity. With this jumper in place, the signal levels are better, but still just barely adequate for the task of recording voice from the SignaLink, even with the RCV pot turned all the way up. I'm still investigating whether the higher signal levels help or hurt the PSK operations. Does anyone else run a SignaLink with the RCV sensitivity jumper in place? If so, what are your observations?

I suppose that's enough for now. What are your thoughts? Have I missed anything obvious here?

Thanks in advance,
Rob / KD8WK

Damien:

You haven't told us anything about your antenna system. It would help to know what kind it is, how it's fed, how close it is to your equipment and ground conductors, and anything else relevant. This is more likely an antenna or antenna proximity problem and less likely it's going to be resolved by any kind of grounding.

From: Damien Gardner Jnr
Topic: 30870 Message: 30876

Thanks Carl,

Hrrm, I guess technically I have three paths to 'earth' from the bus? - The two ground stakes (I went two mainly because I had two on the shed - on diagonal corners, tied directly to the frame of the shed) at either end of the garage, and the mains ground stake - though that's some 70 feet away! Which was the main reason I shoved the ground stakes in.. - Not sure why, but whoever built our house decided to put the ground stake on the other side of the house to the meter box!

The cable from the bus to either ground stake would be about 10 feet - should I remove one stake (and its cable run)? I shoved it in to make sure I had a 'good ground', but maybe having two has complicated the issue? Or maybe having two runs of cable to each stake is causing issues?

I'm kinda curious to know how other folks earth their stations? - Do they bother with a ground stake, or just tie everything to the mains earth?

I guess what's really throwing me here, is seeing such a high p-p signal between the earth bolt on the back of the 897, and pretty much anything else tied to the same earth system, only 1m away!?

Regards,

Damien

Hi Chuck,

Antenna is a TET-Emtron TEV-1 (basically 8.5m vertical), sitting on top of a 1m mast in the top of a rotator, which sits atop a 6m mast. Antenna is fed by ~20m of RG58C/U, terminated to the antenna with the centre to the antenna, shield to the pole. Hrrm, actually this setup has changed somewhat recently - it was previously sitting atop a 5.5m mast, with the guy wires directly below it - now they're about 2 metres below it..? I hadn't considered this an issue, as the antenna was already fairly useless on pretty much every band (I tend to throw a squid pole with a suitable 1/4-wave length of wire up it if I want 'decent' reception!)

Would the change in distance between the guys (aka radials) and the bottom of the vertical have made *that* much difference, that it'd be causing so much RF weirdness in the shack?

Regards,

Damien

30878. LSB LF Shifted

Yahoo group: FT897 (2010)
Date: 2010-08-14 06:10:42 UTC
From: dniitani
Topic: 30878 Message: 30878

Aloha,

One night I noticed that I could not understand anyone on 20 meters LSB. I needed to turn the IF shift knob all the way clockwise to understand what everyone was saying. I decided to do the three resets (V/M + Power, F + Power, Home + Power) but still, I needed to turn the IF shift knob all the way clockwise. I played with option 15 but it made no difference. I'm only able to use 20 meters due to single band antenna and 2 meters seems to work well. Is it time to send it in for repair?

Mahalo in advance

30882. Recorded Message

Yahoo group: FT897 (2010)
Date: 2010-08-14 21:38:45 UTC
From: Barry Young
Topic: 30882 Message: 30882

Some radios have the capability of recording a message such as CQ Call sign for contesting, and playing it back over the air by hitting a key on the radio.

Does the FT-897D have this feature? From what I have read in the FT-897D manual, you can play a CW message via multi function row "o". If not, is there any way to play messages for contesting?

Thanks!

Barry K9BAY

30883. noise level increases after transmitting

Yahoo group: FT897 (2010)
Date: 2010-08-14 22:27:46 UTC
From: Chuck Stroud
Topic: 30883 Message: 30883

Hello everyone-
I'm hoping someone can help me with this question. Like others, I have a noisy radio, but I think this is different. Forty meters normally has a S6-8 noise level for me recently. In the past it has been as low as S4. I know there have been discussions about static crashes at the S7+ level on certain bands, but mine are not present with the antenna disconnected, and the noise is just constant - no crashes. My real problem starts whenever I either tune up the radio (via cw either sending or using a LDG Z-11ProII) or even just by talking on SSB when it is already tuned. Immediately my noise level goes up to an S5 to an S9, depending on the band. It usually lasts at least an hour to return, and turning off the radio doesn't help. I have turned on and adjusted all of the filters, and although some help alleviate the noise, it stays at the same S-level. Any thoughts would be appreciated.
Thanks,
73

No Problem Its easy to do and we have all done it.

Once, after a thunderstorm, my 897 on all bands would recieve on one sideband and Tx on the other ie Rx USB Tx LSB, a full re-set cleared this.

Thanks

30885. yf-122s yf-122c yf-122cn pinout HELP!

Yahoo group: FT897 (2010)
Date: 2010-08-12 08:30:22 UTC
From: sp2swr
Topic: 30885 Message: 30885

Hello!
I am desperatelly looking for yf-122s yf-122c yf-122cn pinout diagram!

If we install optional filters like yf-122s yf-122c yf-122cn there is no problem to see by the radio wich one is actually installed. Thanks to pinouts wich are different for every single model of filter.
The problem is if we use other filter without a board. I used old XF-110C taken from my trusty FT-900. OK1FIG did this mode with inrad board and had no problems!
http://ok1fig.nagano.cz/FT897D/FT-897D_XtalFilters.htm
I saw needed documantation somewhere in the web but I can not find it again!

30886. Re: [FT897] FW: Probably slightly OT - earthing, and lots of RF in the earth system??

Damien:

The quick answer to whether the change in distance between the guys, or any other change, could make that difference is YES. The problem is that it doesn't sound like you have anything preventing RF from following the outside shield of your coax back to your equipment. Because of this, any changes you make to lengths, distances, etc will only cause problems to appear on different frequencies. There's also nothing magical about a "ground" system that it sucks up RF, and even if it did a ground conductor of any length when carrying RF current will create voltage and current nodes that are different for different frequencies regardless of how large that ground conductor is. This is why you can never rely on "ground" cables or straps to correct a stray RF problem.

You didn't describe what you intended to be the "counterpoise" for the vertical antenna--whether that's the mast, the guy wires, or some kind of connection to a ground system. In any case, I doubt what counterpoise you have is resonant at all of your operating frequencies. Since you have nothing to block RF from coming back down the outside shield of your coax, your coax and everything connected to it is part of your antenna system, which includes your equipment, your ground cables, your power connection, your computer, and even your microphone and you. I'm therefore not surprised that you would measure some significant RF around your equipment.

The net result of all of this is that if you simply focus on moving things around or trying to fix your ground connections, all you're going to do is shift around the frequencies that will cause problems. The solution is to define what is your antenna and keep RF off of everything else. Since it sounds like your equipment is also in close proximity to your antenna, you may have to do things to prevent the near field of the antenna from coupling into conductors in and around your equipment and other things it may affect.

There's a number of ways to fix this, but I think it all starts with your antenna. I'm also curious as to how you're tuning this antenna. The antenna you're using requires an antenna tuner, which if you don't have one would explain your poor results with it. The antenna also requires a counterpoise. This is usually either a set of radials or a connection to a ground field of some sort. My personal suggestion is that if you have some space for it, install the antenna away from your house at ground level and bury a number of wires connected to the base for a counterpoise. You can then run the coax along or under the ground, which will help reduce RF coming back to your shack on it. It may also perform better at ground level with a good ground field than it will elevated on

the mast with a smaller set of radials.

Good luck and let us know how it goes.

Antenna is fed by ~20m of RG58C/U, terminated to the antenna with the centre to the antenna, shield to the pole. Hrrm, actually this setup has changed somewhat recently - it was previously sitting atop a 5.5m mast, with the guy wires directly below it - now they're about 2 metres below it..? I hadn't considered this an issue, as the antenna was already fairly useless on pretty much every band (I tend to throw a squid pole with a suitable 1/4-wave length of wire up it if I want 'decent' reception!)

Leon:

While I completely disagree with any thought that "grounding" solves any stray RF problem, and have as yet to have anyone show me why the mythical "RF Ground Loop" has any relevance, this article does in fact show in real terms why any conductor of any real length can't be considered an "RF Ground". In short, it's the answer to this question that's relevant... "When is a ground not a ground?" Of course the answer is... "When there's current!". If you ignore the rest of the conclusions of this article that you can solve stray RF problems with some kind of "ground", it's of some value.

Chuck

30891. Re: noise level increases after transmitting

Yahoo group: FT897 (2010)
Date: 2010-08-16 00:48:38 UTC
From: Steve Yates
Topic: 30883 Message: 30891

Hi Chuck,

The noise levels that you have noticed is probably normal for the band. It will change a lot on 40 m in the summer time depending on where the thunderstorm activity is and where the ionosphere is propagating the lightning crashes at any given time. Without more data I would guess that it is just a coincidence that it decreases an hour after you transmit. But maybe I've misunderstood the problem.

Try using IPO (preamp off) and adjust your RF Gain back so that the S-meter sits at about the peak level of your noise. Then compensate by turning the volume up. This will make the noise much more tolerable. The AGC tends to make the noise just as loud as the signals you are trying to hear but in nature that is usually not the case. Cranking back the RF Gain will restore the natural dynamic range of the signals.

From: Chuck Stroud
Topic: 30883 Message: 30892

Thanks for your insight Steve. I've learned a lot from this group.

It makes sense about the noise coming from thunderstorm activity, and I hope it gets better in the fall and winter. However regardless of the noise level, as soon as I transmit, the background noise jumps another 3-5 S-units. I've done all of the filtering you've mentioned which has helped with the original noise, but this one is strange to me since it only happens immediately after transmitting (on all bands). Any further insight from you or others would be very much appreciated. This is my first radio and because of my limited space I've loved everything about it since I bought it earlier this year.

30893. Re: [FT897] FW: Probably slightly OT - earthing, and lots of RF in the earth system??

Yahoo group: FT897 (2010)
Date: 2010-08-16 02:13:11 UTC
From: Damien Gardner Jnr
Topic: 30870 Message: 30893

Thanks Charles,

I think you hit the nail on the head.. - managed to get onto my 'ham mentor' yesterday, and talked him through my current setup, and he pointed out that the 7.5m of mast below my 8.5m vertical is effectively giving me a slightly off-centre dipole, with one end firmly planted in the earth!.. (which with the braid of the coax attached to the mast at the base of the antenna effectively puts my coax sheild *not* at ground potential, yes?)

So I lowered the mast down yet again (god am I glad I bought a 12v winch to do that job!), and wound 10 turns of coax around a 10cm dia pipe (well, actually a CD Spindle case!), and things seem a WHOLE lot better! - interestingly, the noise level is a LOT lower, but I can actually set DM780 off sending a CQ with PSK31, without having all my USB devices disconnect mid-transmit! I still have 2Vp-p of 7mhz sinewave between the ground on the back of the radio, and the earth bus a meter away (and for that matter, from the shield on the USB CAT adapter to the earth bus), but things seem to be working properly now.. :) - looks a little weird with the coil sitting below the antenna (http://echelon.pinegap.net/~damien/stuff/P8163889.jpg), but I don't see it, so I don't care too much ;)

I *had* originally intended for the guy wires to operate as radials, but once I put my brain into gear and think about it, the bloke at the ham store (no naming names, but .au only has one *licensed* ham supplier.. ;)) gave me a pretty bum steer in a few ways. first was telling me the AT897 was the best option for auto-tuner with the TEV-1 vertical.. I've wished a few times now that I'd got something like the AH-4 which sits up the mast at the base of the antenna... Don't suppose anyone's used the AH-4 with the FT897? Or can suggest a similar tuner that works with the 897? Secondly was telling me to make sure that my guy wires were earthed at the bottom ends, and *weren't* resonant on any band I wanted to work.. After actually thinking about it, a) I would have been MUCH better with a mast-mounted auto-tuner, and b) I ideally want radials which are resonant on every band I want to work, right?

Unfortunately, we don't have much spare room in the backyard - about 2/3 of the backyard is under cover (basically the width of the house, to the back fence, is one big patio..), and that remaining 1/3rd fits a rather large shed.. - I get about a 3m x 3m area that's open to the sky, hence the mast :) If we weren't renting, I'd build a little frame to sit on the patio roof to sit the vertical right on top of that - a 20mx20m aluminium roof has to be a fairly good ground plane ;) Thankfully I can throw up basically any size/amount of masts I want, as behind us is parkland, and the neighbour adjoining our 'open' area of backyard is a looong time friend, and has been trying to find time to get his ham license for quite a while now, so doesn't really care what I run.. He's already offered to let me throw a mast up in his yard if I want to run a long wire or dipole, etc.. :)

Cheers,

Damien

Hi Charles,

Do you have a link to the program download? I looked on eham.net. There are a couple of Voice Key apps that are reasonable. But I think they all require additional hardware.

Thanks!

You will need something that can trigger the PTT and interface to the sound card at a minimum. I personally use a USB sound card so that if anything goes wrong (lightning for example) I have at least some protection on my sound interface, granted its not bullet proof, but its more than nothing. You can usually find these for $2-5 at various places. I got mine for $2 at dealextreme.com.

For the PTT part I use a simple cable that I made for under $10 that uses a serial port. Since my laptop does not have a serial port I use a usb serial adapter. Schematics are on my blog, and are a (very) slightly modified version of what is included in the 'soundmodem' package but has the correct pin numbers for a 897.
http://www.0xdecafbad.com/2009/08/ft-897-tnc-interface/

You are not required to use the mic interface for just playback, but it costs almost nothing extra to make it into the cable and then you have it if you want to do other things.

The software of course has to know that its a serial PTT device and which pin its using to trigger the PTT. There are 2 variants that I have seen for serial, the schematics that I have appear to be the more popular variant, and that works with a variety of packet software as a bonus.

30898. Re: New Ham, New FT-897, New G5RV Antenna, A Few Questions!

Yahoo group: FT897 (2010)
Date: 2010-08-17 17:15:51 UTC
From: MitchM
Topic: 30465 Message: 30898

Thanks to all who replied and the warm welcome to the group.

Most of the time my 897 is my base and I am using the FP-30 power supply. I came across a good deal on an MFJ-969 manual antenna tuner that I use with the G5RV and that seems to work from 80m to 6m when I am at my home. I did get the internal batteries and then I use the FC-30 auto-tuner when I am working as a remote or mobile with a SuperTenna. Things are working very well. I have been experimenting with the HRD software program as well as trying out some others.

I have been looking (so far to no avail) for size M3 thumbscrews to make switching the FP-30 bottom with the standard bottom easier. I was even wondering about modifying the bottom plate to enable both the power supply with the batteries on top of it.

Cheers,

Mitch - KJ4UBX

Thanks Brent.

It seems pretty easy to build. I'll give it a shot. I believe the voice keyer software allows you to set up the triggering pin. I have a Radio Shack and Fry's Electronics near to me. I should be able to get the parts pretty easily.

Thanks again. I will let you know how it goes…

radio shack does stock everything needed for it, although they charge a
premium anymore, I made one out of 100% radioshack parts for about
$10-15. Frys has been doing away with their electronics department over
the last decade, but they may have this stuff since its so common.

Bret,

I am looking at the wiring diagram for the Data Jack in the FT-897 manual on page 18. Just to clarify numbering the Data Jack connector From Right to Left:

Line RS232 FT-897 Data Port Data Port Label Your Diagram

GND 5 or 7 Pin 4 GND Pin 2

Computer Speaker Jack 5 or 7 Pin 3 Data In Unassigned

PTT 7 or 4 Pin 2 PTT Pin 3

Computer Mic Jack 5 or 7 Pin 5 Data Out 9600 Pin 4

Open 5 or 7 Pin 1 Data Out 1200 Pin 5

Am I understanding this correctly? Sorry for being confused. I just want to make sure I have the schematic correct based on the diagram of the FT-897 Data Jack.

Thanks!

I am not sure if you are talking about pin numbers in the DB9 or the
data port on the radio.

So we are all on the same page http://www.ft897.com/FT-897_Pin_Outs
(unofficial FT897 wiki)

The ft897 data port is
Pin Description
1 Data IN
2 GND
3 PTT
4 Data Out (9600 bps)
5 Data Out (1200 bps)
6 SQL

RS232 is http://www.lammertbies.nl/comm/cable/RS-232.html

If you are unsure about the ft897 side, look for pin 2 (GND) should be
able to find it with an ohm meter. If you short pin 2 and 3 together
the radio will Tx. Pin 6 will go high when you have received a signal
(and is unused in my design).

The rest is just using the numbers listed on the schematic. The right
side is the FT-897 side. The left side is the RS232 serial interface.
You will probably use a 9 pin connector so you would want pins 5 & 7,
some older systems have a 25 pin connector which would be pins 4 & 7.

Did this clear it up? I was unclear on what you were asking so I
figured I would just cover about everything in the hopes that somewhere
is what you were looking for.

30907. Connecting FL-2100B

Yahoo group: FT897 (2010)
Date: 2010-08-18 10:18:15 UTC
From: w9wtf
Topic: 30907 Message: 30907

Hello all.
I just bought a Yaesu FL-2100B amplifier from a friend. My dilemma is
that I already use both ports in the back of my FT-897 for a LDG AT-897
and a sound card interface cable. I plan to get some type of switch so that I don't have to unplug the CAT/lin plug each time I want to use the amp. My question is; Will the 897 activate the amp itself or do I need to set up a manual switch of some type?
All advice is welcome!

Bob - W9WTF

mac serial cable for the data jack (the old style that is a 6 pin din)

You can either buy a cable and cut one end off and use that or buy an
end and wire your own cable. It seems easier for many to just but the
cable and cut one end off.

For the ground on the computer mic and speaker 1/8" jacks, I assume the GND side is routed to the GND on the data jack as well as the other pins requiring GND.

I will use an ohm meter to verify all connections.

Thanks again Bret, This is going to be awesome if I can get it to work. It is all in the wiring :).

Bret,

I actually found a PS2 mouse cable that fits. But I may need to trim down
the connector because it has extra molded casing around the connector. I
can cut off the other end. [?]

Thanks!
73, Barry K9BAY

Hi Bob,

I think you will find that you need to use a relay operated by the 897 to switch the linear as, from memory, the FL2100 uses a highish voltage, possibly AC, to operate its relay. It is a long time since I played with one, though.

You need this and a amplifier keying cable that fits your rig...

Iain -

I am certain that there are electronics resource shops in the UK.

Normal going rate (on eBay) is about $20.00 (US) for the powercord plus
shipping.

Another option is to fabricate cable:

Plug - $5.00 (US)
Wire (#12) - about $00.40 per foot
Fuse Holders (Hefty ones) - about $2.00 (US) each
plus
two (2) 20 Amp fuses unknown cost.

You should be able to fabricate the cable for about $`15 - $16 (US) or less.

Of course, you may be able to do better at a local hamfest.

From: oceanbiz01
Topic: 30922 Message: 30922

I recall seeing a thread on how to open the TX for MARS/CAP. I am assuming that this mod allows transmission on any frequency from 1.8 MHz on up. Does it allow transmission on 220 MHz for CW, SSB, and FM ?
In the VHF contests, lot's of guys ask if you can go on 220 MHz for a multiplier. I would like to ba able to do that.

30926. 160 meter operation

Yahoo group: FT897 (2010)
Date: 2010-08-21 17:12:15 UTC
From: amccom2
Topic: 30926 Message: 30926

Hams,
anyone ever get this thing to operate on 160? I have a 160 meter loop with remote tuner, and the unit goes balistic with feed back when trying to operate on 160. lots of ferrites and grounds. no linear. My galaxy V never gave me all the problems this baby has with 160 and yes even 75 meters. Tuner is at antenna terminal end so this SHOULD not be a issue. If you operate on 160..... what is the trick other than getting my galaxy V out of moths balls.

Well, one thing I DO know. My FC-30 will not tune on 80 or 160. My MFJ 941 will tune the radio down to 80 meters on a G5RV, but it won't tune to 160 meters. I'll have to get a longer wire and try again. I don't know anything else though.

From: Dan Schaaf
Topic: 30926 Message: 30928

Let me tell you something about low band antennas. G5RV is a perfect example. And, I have been there and done that on 160.
If the antenna is significantly short (much less than resonant length should be) then first, you will lose a lot of power in the tuner trying to match the short antenna. A T type tuner will lose up to 25% of transmitted power in heating the inductor in the tuner. I warped 2 rotary inductors using my G5RV on 160.
On 80 meters, I had to add or subtract wire on the legs of it to get a resonant point. I was pushing a KW but the concept is the same, 1 KW or 100 watts.

Now, it seems to me if the mismatch is really large, you may also get RF feedback along the shield of the coax. On low bands it takes a hell of a lot of ferrites to hold the RF back. The FC-30 is not designed to match greater than 3:1 SWR if I am not mistaken.
The matching is best done at the feedpoint of the antenna in the case of low band operation with a short antenna. Then you will not heat up the coax and the tuner.

Hi,

I have used my 897 on 160 into a multi band antenna which was designed to
only go to 80m without any problem. I did NOT use an auto tuner but rather
a manual one and was able to have a number of contacts on the setup. It works
fine on 80m too, of course. I would not use an auto tuner, though, as i believe
that a manual tuner can be more inteligently adjusted than an auto one. Just
my opinion though.

At our local club, we use a TS2000 and FL7000 amp into a full wave loop each
year for our local 160m contest and have had very little problem there, either,
even though the antenna is only a matter of a few metres above the shack.

You mention lots of grounds, you should only ever have ONE RF ground for
the shack and radio gear, which must, of course, be totally separate from
the power safety ground.

I can't tell you, but I operate 160m often with my FT-897D, with and without an amp, and aside from the usual glitchy things that annoy us all -- for instance, I get into one set of computer speakers and have to turn them off when I'm on the top band (but oddly not the other set, which only seems affected by my 2m operations) -- I don't have any significant issues.

Now, 80m is more problematic here, but then it doesn't seem to matter which rig I am using on 80, and the itself 897 is happy enough on either band.

Do you have everything grounded? How far from an earth ground are you?

YMMV,
Rob / KD8WK

Like most things today the plastic body is probably allowing unwanted RF thru the casing not matter how hard you try to ground the chassis grounds. Seems that the engineers would have made better designs to defeat this known issue. Almost makes for a class action lawsuit to get some real metal covers with shielding :)

Bret,

I think I have all of the parts assembled. Fry's had all of the parts (if you cross reference NTE with the semiconductor number) except they were out of stock of the 1N4148.

I have found the USB wiring diagram. This one is for USB to PS2 mouse. In your earlier diagrams, you refer to serial RTS and GND. Here is the wiring diagram for the PS2 to USB. I am not sure what RTS maps to on the USB wiring diagram. The rest is straight to the radio.

http://technix.yahooboard.net/modding-diy-section-f8/ps-2-to-usb-wiring-diagram-t49.htm

What are your thoughts?

Thanks again for your help.

mac serial cable for the data jack (the old style that is a 6 pin din)

You can either buy a cable and cut one end off and use that or buy an
end and wire your own cable. It seems easier for many to just but the
cable and cut one end off.

Sam:

What plastic case is that on which piece of equipment?

Mike:

First of all, what do you mean by "ballistic with feed back"? Is the radio doing weird things when you TX on 160 or is it that the transmit signal has other noises on it?

If you think it's RF getting into the radio, the first thing to do is to test the radio into a dummy load to see if it works that way. If that works, try disconnecting anything other than power, mic, and antenna and try the radio that way. If it works that way, then something else you had connected was letting RF in--but that also means you have stray RF. If it still has problems, and you still think it might be RF, then you may very well have not yet solved your stray RF problem with all of the ferrites and grounds. That would bring up the question of where the loop is relative to your equipment and other cables and how, exactly, you're feeding that antenna.

Hi everybody,
the very expensive MB2013A i.c. of my FP-30 is history now :-(
I'm in big troubles to find it as a spare part and some friends
said to me that, if found, it's really VERY expensive.
Surfing on the web, I found it also used into the FP-29 power
supply and into the ICOM PS-125 too.
Can someone help me to find a good source (selling to Italy)
where I can buy that part?

Thanks in advance for any help,
"Joe", IT9BLB/KF6FBC

30937. New FT-897D, need antenna ideas

Yahoo group: FT897 (2010)
Date: 2010-08-19 20:12:30 UTC
From: mstarmer1
Topic: 30937 Message: 30937

Well when I arrived home from work I found I had my new 897 and now the fun begins.

One question I have is that the only way the power level can be changed is thru the menu? I sure thought there would have been an easier way to set that up...

Looking for ideas for my first HF antenna. Where is all the HF action at? I'm only a tech but would like to listen. Also trying to learn CW, so maybe a 40 meter. Limited on antenna due to HOA and location, something portable is probably my best bet.

Any ideas or files to point me in would be appreciated. I keep trying to search but the search function seems to be down, keeps getting errors or that it's undergoing maint?

Thanks,
MStarmer

Chuck,

I'm not sure I understand your original comments.

Is the noise after transmitting (and staying about an hour) audible on all bands (albeit at different volume levels for different bands)? My interpretation is that it is. Does this include 2m/70cm?

When you have the noise after transmitting have you tried disconnecting the antenna? Does the noise then disappear or is it still audible? If the noise disappears I would think you have someting wrong with your radio. If it doesn't are you running on an external power supply? Have you tried batteries?

30939. FT-897D display flashing

Yahoo group: FT897 (2010)
Date: 2010-08-22 04:21:20 UTC
From: Frank
Topic: 30939 Message: 30939

Hi:

I've had the unit for a week and it has developed an occasional (60%) annoying habit when powering on. On some bands the display characters will strobe off and on, except for the S 'meter' scale.

The 'fix' is to poke the Data din socket with my pinky.

Anyone else experienced this?

Serial begins with 0G so the set is pretty fresh from Yaesu.

30941. Flashing Display FT-897

Yahoo group: FT897 (2010)
Date: 2010-08-17 01:58:12 UTC
From: Frank
Topic: 30941 Message: 30941

Hi Guys:
I've got a new FT897 s/n 0G.... (May 2010) a few days ago. I don't know if it is my fat fingers running an unfamiliar radio or what, but often when I turn it on, the display flashes on most bands--everything but the S meter bar & legend. I've done the ugly reset (home & power) to no effect.

Is there a menu item I've inadvertently poked?

So far I've found unplugging the RT Systems programming cable does the trick, just why I don't know.

Anyone else seen this little problem?

Thanks for your thoughts Collin - they just came through today from the reflector (after 6 days!).

The noise increase is just on the band that I transmit. If I switch to another band and transmit it also increases there, but not until I transmit. When I go back to the original band, the noise is still present there as well. Therefore it doesn't appear until I transmit on that band, and the effect it is independent from the others. I notice it on every band but 2m/70cm. I usually use 80/40/20/17 ssb/cw and it occurs independently on each.

When I disconnect the antenna, the noise disappears and comes back when I reconnect. I have not tried to run on batteries yet as I have not purchased them, so I am using a power supply (SEC 1223). I've wondered if it has something to do with the antenna (G5RV), but everything tests fine there as well, and that wouldn't make sense. My anenna tuer is a LDG-Z11Pro II. Been very satisfied with it as well.

Thanks again for any insight from you or any others on the reflector. I emailed Yaesu over a week ago, but still have not received a reply.

Is it possible that the increase in noise comes from the fact that once
you transmit, the antenna tuner has tuned the antenna and therefore you
are getting better reception of existing noise ?

I suspect Dean is correct about your auto tuner tuning and passing a higher signal level through. Since the noise goes away when you disconect the antenna it must be coming from "outside". When noise levels go up in the shack I usually unhook the antenna to see if it's external noise.

30950. RE: [FT897] Re: Recorded Message

Yahoo group: FT897 (2010)
Date: 2010-08-22 20:52:10 UTC
From: Barry Young
Topic: 30882 Message: 30950

Part of this thread has been discussing the specifications of building a PTT cable / interface using the Data Port on the radio. I don't do digital, and just want something inexpensive to play a contesting CQ message. The posts included a simple solution using a few electronic parts to issue a Push-to-Talk and play a repeated message via a computer USB port using software (ie Voice Keyer supports serial communications) . Sure wish Yaesu would have built this functionality into the FT-897D. It is interesting that it can send CW messages and not voice. According to a friend, his FT-450 has this feature built in (I quickly looked at the FT-450 manual and didn't see any documentation on it). He hasn't really had time to go through the FT-450 in detail yet. Maybe be for portability reasons, they elected not to include sending voice messages on the FT-857 and FT-897.

The upside is that I get to build a interface and cable to send voice messages which is the fun part of this hobby.

Thanks!

Yeah, that's a problem I have with the 897, too. There is Menu Mode 057 which allows you to set the MEM/VFO CH knob to select RF Power when the knob is depressed, but then it becomes difficult to tune the receiver outside the ham bands because you lose the Mhz step function. You can also control the power levels via sliders from Ham Radio Deluxe if you have the CAT interface connected to a computer.

Practically, the power control is really only a problem while trying to tune the amp. It would be nice to be able to access Menu 075 at the touch of a button.

Were I to design the human interface, I would have made the button beside the CLAR knob step through several functions, and RF Power would have been one of them. I would also have made the M/VFO button cycle through VFO A -> VFO B -> MEM. And finally, I would have made the HOME button programmable for both short and long pushes. (And, for me, the short push would have been to cycle VOX.) But, alas, for some reason Yaesu didn't approach me to provide input when the rig was designed.

> Looking for ideas for my first HF antenna. Where is all the HF action at? I'm only a tech but would like to listen. Also trying to learn CW, so maybe a 40 meter. Limited on antenna due to HOA and location, something portable is probably my best bet.

You can listen anywhere with virtually any antenna, so it all depends on what you like to listen to. Generally, 40 meters is good for getting a taste of what ham radio is all about, and 80 can be, er, "interesting", at night, if you like the seedier side of things. On 20, you often can only hear one side of the conversation.

Happy hunting with your 897.

With the 8900 plugged into a regulated power supply or wired to the car... Is it safe to simply turn off the power supply or car to shut down the radio and turn on the power supply or car on (with approh appropriate surge protected autoswitch from anderson).

Or MUST one always power down the radio before the external power down and the reverse to power up.

I am concerned that my kids may forget and simply turn off the source power.

Actually, yes, an autotuner may not be able to handle the short antenna, but auto tuners are typically L tuners and have only 2% loss, where as manual tuners are typically T tuners and there is a great deal of loss. These loss figures pertain to 160 meter operation. The figures diminish as you go higher in frequency.
I now use an MFJ-998 autotuner ant it is the cat's ass. And it handles full legal limit.

Subject: RE: [FT897] 160 meter operation

Hi,

I have used my 897 on 160 into a multi band antenna which was designed to only go to 80m without any problem. I did NOT use an auto tuner but rather a manual one and was able to have a number of contacts on the setup. It works fine on 80m too, of course. I would not use an auto tuner, though, as i believe that a manual tuner can be more inteligently adjusted than an auto one. Just my opinion though.

At our local club, we use a TS2000 and FL7000 amp into a full wave loop each year for our local 160m contest and have had very little problem there, either, even though the antenna is only a matter of a few metres above the shack.

You mention lots of grounds, you should only ever have ONE RF ground for the shack and radio gear, which must, of course, be totally separate from the power safety ground.

73....Eric VK2VE.

No body? You mean nobody.

I have 51 countries worked on 60 and all 50 states.
K5YY and myself issue the WAS certificate for 60 meters.

And very soon we will be issuing DXCC type awards for 60 meters.

No body on 60 M anyway.
You can software wide band it and program the PROPER frequencies into the memories.

I did that with mine so I could get on 60 M when it became available.
I have a better radio for that now. I cannot get my 817 to revert back to normal now.

You need to go to the radio's memory section (press "V/M") and try to
select memories 601 through 605 (go to memory 001 and turn the "Mem/VFO
CH" knob to the left). If you can, the unit has the channels, and
that's what you must use, not manually tuning the radio. If you have
the USA FT-897D manual (if not, you can download it from the Yaesu web
site), that's documented on page 23.

OK, now, if he lost M601 through M605, he can now VFO dial to each channel of 60 meters and store them in his favorite memory locations. The MARS mod surely opened up the entire spectrum.
I did this on my FT-920 and FT-2000
I just select the appropriate memory location for each channel.
However, it is critical that he make sure that the stored frequency in USB is EXACTLY the legal frequency.

DannyIn this group go to FILES: Select Wideband.htm file near bottom of the list. The following text is taken from that file.FT-897 Mod:- (taken from Mods.dk Site)
Remove top cover of radio being careful to remove speaker and battery switch connectors.

Locate Q1049 number on chip is HD64F2134FA20.. There are 9 solder pads connected to this chip through D1044, D1047, and D1048. On my radio pads 6, 7, and 8 are populated. Number 1 pad would be closer to the rear of the radio.

Populate pads 1, 2, and 3 with a piece of fine wire or just bridge the gap with solder.

Reset the radio by pressing and holding "V/M" and "F" buttons while turning on the radio. You will hear a series of beeps.
After mod radio will transceive 1.8-56 MHz, 137-164 MHz, and 420-470 MHz. With this mod it will not transmit between 118 and 137 MHz.

Tried to use my radio out of the Ham bands and got TX ERROR. So I believe that I have a non-D. Works great, but seller shouldn't have advertised as a D if it wasn't. I have no complaints at all about the radio. Next question is how do I expand it for MARS. Is a software expansion or a jumper change? I know this has probably been discussed before, but I am finding out that finding past threads on this group isn't very user friendly especially for me.

Thanks,

Danny

MARS mod
Tune it to any non ham frequency- i.e. 11m. Key the mic if you do not see TX
error, then it has the MARS modification

AT897
Remove the four screws on the case and then the four screws on the inside of
the unit. These screws go through the circuit board and attaches to the
case.

If you want to "Tune" on 60 meters for the purpose of adjusting an antenna tuner , it is better to go to the channel of interest, and whistle into the mic. Then you will not be out of band.
Or, if you have a tone generator, connect it to the mic input and generate a tone within the allowed audio spectrum.
Do it briefly. I know of no other way.

You are not allowed to tune up on 60 meters. SSB only, no CW.
One should read the rules .
A non D model will not tune as it is out of band.
A D model will not tune as it is programed not to. The proper frequencies are programed into 60 meter channels

> The 'fix' is to poke the Data din socket with my pinky.

A flashing display means the DDS synthesizer is out of lock.

Open up the top, and make sure that the TCXO (this is the module
in the far right top corner, between the big shielded block
(which is the DDS) and the back of the radio, is fit completely.
This module is socketed and about 1 x 1/4" in size.

If this module is tight, and you have warranty, I'd suggest
to do the warranty thing. While I successfully done component
replacement inside the DDS module on several radios,
it really is not for the faint of heart as the majority of the
components are on the *bottom* of the DDS PCB and disassembly
of the DDS module is a major pain.

If the radio is new, warranty is the safer choice.

The CAT port lets you, I even wrote a perl module that in theory should
work in osx, windows, linux (all other posix systems).

You will need a CAT port and an interface from the soundcard to the
radio somehow. That still means cables of some sort. Quality may be
lower, but you might be able to get away with a computer speaker next to
the radio mic, thus only requiring a CAT cable which can be purchased.

Writing an app that would just play a pre-recorded sound file should not
be difficult (which can be done via a wide range of tools, many
operating systems/distributions come with such tools)

http://www.0xdecafbad.com/2009/08/yaesu-ft-8xx-cat-perl-module/
my $err = $Radio->pressPTT();
my $err = $Radio->releasePTT();

My FT-50 handheld could record a 20 second clip on an ISD1000 chip
integrated into the keypad. This is the only radio I have seen that
yaesu made which records and plays back (from mic/air to speaker/air).

One thing that makes the 897 menus more tolerable is to run the radio with a computer and Ham Radio Deluxe (HRD). The LDG AT897 tuner works well with the radio as does the LDG AT200 PRO.

Can you sneak up a Hustler 5 band vertical during the times you want to use it and lay it down next to a fence when not in use? It works well with a tilt base.

If you have a DTMF mike you have a two tone and a single tone audio source.
Two tone used to be a standard way of testing SSB transmitters.
A single tone will give you a constant carrier, which is still not allowed on 60 M.
The best way is to start out with a resonant 60 M antenna you do not have to tune every time you use it.
That is what I used until I found very little activity. I still have 60 M a whip for mobile.

If you want to "Tune" on 60 meters for the purpose of adjusting an antenna tuner , it is better to go to the channel of interest, and whistle into the mic. Then you will not be out of band.
Or, if you have a tone generator, connect it to the mic input and generate a tone within the allowed audio spectrum.
Do it briefly. I know of no other way.

You are not allowed to tune up on 60 meters. SSB only, no CW.
One should read the rules .
A non D model will not tune as it is out of band.
A D model will not tune as it is programed not to. The proper frequencies are programed into 60 meter channels

Subject: [FT897] 60 Meter question

If your FT-897 shows a TX ERROR when you try to tune up the 60 meters frequencies, is this an indicator that the unit is a non-D? If so, how do you modify it to work on the 60 meter frequencies?

Thanks in advance,

Danny

From: scotchmandr
Topic: 30953 Message: 30967

I am referring to the 897 also as the PS manual is claiming an ORDER. But when hooked mobile, the ignition is the first thing usually turned off.

With the insertion of an Automatic Power ON/Off Switch to prevent "start up" surges... Should it be ok.

See here: http://www.powerwerx.com/fuse-holders-fuses/automatic-power-off-switch.html

That is a "loaded" question ;-} You didn't give much info on space to run wires, access to trees, grounding, etc.

Anything that is visible would probably violate your agreement. So, I would use a FC-40 with a vertical or horizontal wire. You will need access to a good ground, water pipe, entry ground point. That is what we use at our condo. I paid about $250 for the FC-40 at GigaParts.

Well when I arrived home from work I found I had my new 897 and now the fun begins.

One question I have is that the only way the power level can be changed is thru the menu? I sure thought there would have been an easier way to set that up...

Looking for ideas for my first HF antenna. Where is all the HF action at? I'm only a tech but would like to listen. Also trying to learn CW, so maybe a 40 meter. Limited on antenna due to HOA and location, something portable is probably my best bet.

Any ideas or files to point me in would be appreciated. I keep trying to search but the search function seems to be down, keeps getting errors or that it's undergoing maint?

Thanks,
MStarmer

From: colin.bell99
Topic: 30883 Message: 30971

Chuck,

OK and interesting the different thoughts others are having on your problem.

What I would try, before you try a different tuner, is to:

1) Create the noise then disconnect the aerial from the tuner and the tuner from the radio then connect the aerial directly into the radio.
If the noise has disappeared then suspect the tuner.

2) On the Z11ProII can you put it into bypass (I have an AT897 and briefly pushing the tune button causes the tuner to be bypassed)? If you can, create the noise and then bypass the tuner. Does the noise go away?

3) After creating the noise disconnect the aerial, earth it and then reconnect the aerial again. If the noise is still there disconnect the aerial and earth the input into the tuner then reconnect the aerial.

4) Have you tried turning off the agc in the FT897?

I would hope that you dont keep the programming cable in all the time ???

you should be doing your programming and then removing the cable
else that interface cable could well be causing your probs cuz the radio
thinks
you want to go into programming mode
DONT leave it permanently plugged in :)

30973. noise after transmit

Yahoo group: FT897 (2010)
Date: 2010-08-23 08:28:20 UTC
From: John Randall
Topic: 30973 Message: 30973

Hi all, Just wondering if its not a static build up problem. If he earths the antenna for a few seconds and then connects it , does the noise reduce or stop. Another though is that sometimes when neighbours get tvi, they resort to jamming methods to get back at the ham. Its been know to happen, so worth a check on this as well.

Hey Bret,

We had some discussion on this prior threads and you posted a schematic of an interface, that will hopefully work with software like VoiceKeyer. I did have one question about the USB to RS232 as USB doesn't appear to have an RTS. I posted a wiring diagram on a thread and hoping to get a response from you.

Thanks!

The CAT port lets you, I even wrote a perl module that in theory should
work in osx, windows, linux (all other posix systems).

You will need a CAT port and an interface from the soundcard to the
radio somehow. That still means cables of some sort. Quality may be
lower, but you might be able to get away with a computer speaker next to
the radio mic, thus only requiring a CAT cable which can be purchased.

Writing an app that would just play a pre-recorded sound file should not
be difficult (which can be done via a wide range of tools, many
operating systems/distributions come with such tools)

http://www.0xdecafbad.com/2009/08/yaesu-ft-8xx-cat-perl-module/
my $err = $Radio->pressPTT();
my $err = $Radio->releasePTT();

> It is interesting
> that it can send CW messages and not voice. According to a friend, his

> manual and

My FT-50 handheld could record a 20 second clip on an ISD1000 chip
integrated into the keypad. This is the only radio I have seen that
yaesu made which records and plays back (from mic/air to speaker/air).

Are you just wanting to run the radio or work digital mode? All it takes is the cable from the cat port to the radio and HRD if you just want to connect to the radio. If you want digital mode, you will need something like Signal Link USB.

I ran my 897 to a Acer Netbook on XP. On another laptop with Vista, I got the USB port dropping out after about 10 minutes and never found a patch to keep the USB port working. So much for Vista anyway.

I chose the RT Systems cable to interface with. It's supported by Yaesu and RT Systems and can be ordered with the ADMS/RT Systems software. I bought it directly from RT Systems and am using it on a Vista 32 Dell laptop with HRD 2636- works great and is very high quality construction.

With the 8900 plugged into a regulated power supply or wired to the car... Is it safe to simply turn off the power supply or car to shut down the radio and turn on the power supply or car on (with approh appropriate surge protected autoswitch from anderson).

Or MUST one always power down the radio before the external power down and the reverse to power up.

I am concerned that my kids may forget and simply turn off the source power.

Billy, All:

I wouldn't say that this is a general rule. In fact, many of us have our mobile radios switched with the accessory line (mine with a 50 Amp relay) and simply shut off the car with no ill effects. While I don't use my 897 in that kind of situation, I have powered it down numerous times by simply dropping the supply line and saw no problems.

There have been some radios that have had problems with this, such as not properly saving the current operating state or memory updates when power is simply lost, but I believe that is a small minority of radios operating today.

The only other possible issue might be any erratic power supply behavior when turning supplies on or off. In most cases this should not be a problem, but then I'm not sure I'd want my radio connected to power in a car while starting the car (which is one reason for the relay).

That is the way the tuner is designed. I have the Z100 Plus and it uses the ACC port. You should still be able to use the CAT port with HRD, as the LDG tuner more than likely has a seperate din jack. I recallI reading that in the documentation or info on the LDG website on the website when I was researching tuners.

Yes, that is absolutely right. I looked through the manual for the LDG 897 Plus, and there is a open jack, on the back of the tuner labeled, Computer. So now a new question has arisen. Can the LDG AT-897Plus be tuned via the HRD software? Thanks to all of the responses. Now to decide what interface.

Well, I always follow the procedure as stated by Billy Rose- This also is the same procedure that came in the FP-30B Power Supply instructions- I don't know if a different procedure would cause harm or not but I'm not going to take a chance- However, if in a mobile station, and power switch (ignition?) and FT-897 switch are "on", then when starting the engine, the transients that would appear, might cause harm-

> That is a "loaded" question ;-}

Yep, they always are aren't they?? :)

Well first off no trees in yard, back yard is probably 60x30 but in view of all the other neighbors. I was able to install a diamond x-50 on my deck by painting it the same color, just looks like a umbrella without the shade or a stick.

I did order a Super Antenna so I had something to put out in the yard and try to at least tune in a bit to see what's going on and learn a little more about this radio! If nothing else it's a portable field day kind of antenna. Looking around it looks like the motorized TarHeel type antennas are popular to hide in plain sight and remotely tune. I haven't sprung for a tuner yet and am simply looking to play a little on the tech portions as I study for my general license.

This would be made a whole lot easier if the "search" function for the groups was functional and I could search thru all the messages for the info that has already been posted.

Thanks,
Mike

Many people leave their radio connected to their antenna during a lightening storm without I'll effect. That doesn't mean it's not a risky behavior. Turning off your power supply with the radio still on IS a risky behavior. You have no idea how voltage will decay or how the powered radio circuits will respond to the decaying voltage. I would not recommend it on a routine basis.

30987. New FT-897D, need antenna ideas

Yahoo group: FT897 (2010)
Date: 2010-08-23 23:44:59 UTC
From: Kim Scheidel
Topic: 30937 Message: 30987

With the FT-897D I wanted something portable. I went with the Ventenna Companies HFp http://www.ventenna.com/ . I can take it along just about any where. When I take the motor home out, it comes along with the FT-897D. When we get to where we are camping I set up the HFp. I purchased the vertical first and added the dipole kit later. I like to use the dipole on my patio. I put the painters pole in an old umbrella stand and set up the HFp from 6-20M.

A local club here in Sacramento had the Ventenna Co. do a presentation last week. They had a vertical one set up on 40M. First contact was on CW to Mt Vernon, Virginia. They had a 20M dipole set up and heard both U.S. stations and Australian stations. They tried to make contact on 20 meters but ended up having a bad connector on one end of the coax. I have used the 20m dipole with good success.

You can check out reviews on e-ham for all antennas. Here is the link for HFp reviews. http://www.eham.net/reviews/detail/2737

30988. FT-897D display flashing

Yahoo group: FT897 (2010)
Date: 2010-08-23 23:52:17 UTC
From: Frank Statham
Topic: 30939 Message: 30988

Hi Jan:

Thanks for the quick reply.

I wiggled the TCXO on its connectors but it made no difference. I am going to pack it off to Yaesu.

The problem lies deeper as it only affects some bands, such as 14 mHz. For instance, if I tune down past 13.9 mHz, I hear a relay click and the display stops flashing and returns to normal. Tune up past 13.9 and it begins to flash.

Sounds to me like the synthesizer's VCO is just on the edge.

My last job before retirement was as a bench tech in a Motorola repair shop. I know my limits around SMC and multi-layer boards!

From: Barry Young
Topic: 30968 Message: 30989

Patrick,

With my Z100 Plus, on 20 Meters, for example, I have tuned the radio on several frequencies (upper and lower) and it seems to very stable across the band. The SWR will vary slightly based on the antenna length (resonant). The SWR is lower at the low end of the band and a little higher at the high (which makes sense based on the antenna length). Now when I switch bands to say 40M, I have to retune at that time. It doesn't do the full tune just tells the tuner to move to 40 M.

On the HRD tool menu, it does say LDG Electronics ATU. You might want to post the question on the HRD forum to find out more info. If you find out how HRD works with the LDG Autotuners, please share it with us on the FT-897 forum.

I hope this helps.

73, Barry K9BAY

Yes, that is absolutely right. I looked through the manual for the LDG 897 Plus, and there is a open jack, on the back of the tuner labeled, Computer. So now a new question has arisen. Can the LDG AT-897Plus be tuned via the HRD software? Thanks to all of the responses. Now to decide what interface.

Hi Frank;

I have the same thing happening with my FT-817D. Every once in a while when I turn it on it flashes and becomes unusabe. I turn it off and on several times until the display becomes steady again. I did not notice that it was dependend on the set frequency though. I seemes to me some wiored software bug...

Patrick,

You have had a few replies but none have given the full answer.

Personally I have a RigExpert standard combined sound/cat USB interface and I am very happy with it.

It does not matter what CAT control solution you choose, so long as it plugs directly to the FT897 cat port and works correctly (I disconnected the AT897 cat and tested my FT897 with CAT control before I reconnected my AT897, it took about 20 minutes for me to be satisfied it was OK).

Assuming you have your AT897 connected as per the LDG manual just plug the cat din cable into the cat out port on the AT897, ensure the FT897 and computer port connection parameters are the same (line speed stop/start bits etc) and it should work.

My set up works fine with HRD and Mixw. For cat control you need to decide how you will key the rig etc but if you want to use PTT from a mike or morse key you just need to plug them in. The software still records frequency, time etc.

Of interest I notice LDG have changed the design of the AT897 (I think it is called the AT897plus) and there is no longer an ACC jack on the AT897Plus anymore.

Just bought an AT897Plus last month, unless it's an older model, but I don't think it is, it does have the acc jack. I haven't used it w/HRD yet, but the tuner works great! Bought the AT Blue SWR metre at the same time, both great products thus far.

Starting with, but limited to radios with serial numbers with the letter ☐M☐ the AM Ceramic Filter located at CF1005 on both the FT 857 and 897 tends to develop an internal short which causes the ☐popping☐ static sound. The filter is marked TOKO A455HA. It costs a less then $5.00 even from YAESU. The replacement is rather simple and requires no alignment but you must remove the MAIN UNIT PCB and have a good soldering iron and solder sipper. If you DIY it the filter has 5 pins.

I appreciate your desire to be on the safe side, but I've never seen this problem with any radios using standard power supplies or even in cars (with the stated disclaimer about starting) nor have I ever heard of such problems. If you have a power supply that somehow exceeds the rated voltage at turn-on or turn-off, you should certainly fix that, but that's another issue. There should be absolutely no problem with supply voltage decay on any radio. If you know of any I'd be interested in why they have that problem.

As I understand it, the 'M' designation denotes a November manufacturing
date. But, which year?

I've never been in an auto accident. That doesn't mean they don't happen. Look, you do whatever you think is right. I will take the extra seconds to turn off the radio first. BTW in my mobile installation the radio is direct connected to the battery, so it must be manually shut off anyway. Good luck, and I hope you never lose an expensive radio to a power kill maneuver.

Chip,

You have to bear in mind that the power switch on the 897 is not a 'real' On/Off switch, it is a 'soft' switch and some parts of the radio is running even when switched off by the front panel switch. So at least the CPU will see any switch-off transients.

A slightly different question: I have my 897 on the desk with the switching PS in it. When done, I always power it off using the front button and then unplug it. I reverse the process to turn it on.

However, I never reach around back and turn off the switch on the PS.

Does anyone see any problem with this approach, in particular to the PS? I presume the PS switch simply interrupts the line current and the PS is none the worse for the wear, right?

In particular, there is power to the mic, as the MH-59 can be used to turn power on/off. Some radios (although apparently not the FT-897) can even be powered up via an external command on the serial data port when power is off.

Don,

My FT897 has had this problem. It is a 2007 (L) model and from previous posts on this subject I believe other 2007 radios have also had the problem.

Added to which, in most modern 12V powered radios, the PA and probably the
driver stage is/are normally connected directly across the incoming supply.
It is unusual to have any protection like (internal) supply fuses to protect
the PA and diver devices.

Chip and Charles,

those many people will possibily find that one day it was a very silly thing to
leave their radio connected to the antenna during a storm.
as for switching off the radio by turning off the car ignition switch rather than
turning off at the radio is much less riskier. I have never heard of a radio being damaged by that and none of the dozen or so radios that I have owned over the last 30 years

cheers
Dave

Thanks Colin. I did some research, and did notice both the back of the AT 897Plus tuner, and in the manual, that I can use both the tuner, and the CT-62 cable. So looks like I will be using the CT-62(USB) with HRD. Thanks for the reply Colin, and thanks to all that replied.

Then you've been much luckier than you might believe. As a former TV repairer, comms equipment maintenance officer in the military, computer geek of 30 years and radio amateur for just shy of 20, I can honestly say I have seen many tens of thousands of dollars of equipment damaged by being shut off at the power supply or unplugged without being shut off at its power switch first.

In recent years the tendency has been less toward hard damage and more toward scrambling of computer brains as a result of improper shutoff. But over all that time, I've seen lots of exploded equipment that couldn't handle the surge of suddenly being stuck on the electrical grid.

Anything with a computer in it can have that memory scrambled, for example, so even if you don't explode the equipment, you may cause it to lose its programming or slightly alter that programming in unusual ways when that initial spike of voltage hits it, or when the weird decaying shutdown voltage occurs. This is the most common issue I've seen in recent years with amateur radio gear and power-supply cutoff. I've specifically seen this happen on my own FT-897, and have had to hard reset it once as a result.

It's definitely less risky than lightning, but the risk is far from zero.

Chuck-
In addition to my previous post, once you have the rubber ring off, you will have access to the hex set screw. If you remove the knob, you will then have access to an adjustment that sets the "drag" for the knob. You may want to adjust this if you feel that the knob "spins" too freely. Reverse to re-assemble.

Great, I did just that. What was interesting was that by tightening the spring actually tighten up the shaft. Must be a nut on the other side of the face plate. I was wondering how I was going to get to it, but I guess I don't have to. The radio has traveled with me on a few trips and went through on heck of an auto accident in AZ. It is probably a wonder that it works at all. I am using it as a back up as my Kenwood is in the shop.

Anyway, thanks again for your help, Carl.

I appreciate your perspective and as far as I'm concerned people should do whatever makes them feel good. However, there's a significant difference between communications gear and some other types of electronics, such as computers. In general though, if things tended to break when there's a power outage, we'd have some major class action lawsuits.

In the case of communications equipment, it's common for them to have power dropped without first using the power switch on the radio, either by disconnecting a cable or by turning off power supplies. As I've asked before, if someone can find a reason that some piece of communications equipment would have a problem with that (a specific case), I'd be real interested in hearing about it.

Chuck, just remember that the line between "communications gear" and "computers" is pretty fuzzy any more. I would venture to say that it's hard to find any modern ham gear that doesn't have a fair amount of microprocessor circuitry in it, not the least of which would be the FT897, to which this list is devoted.

The rubber peels off easily, like a rubber band. I have an even worse problem. My knob got bumped while inside a scooter trunk and broke the PLASTIC shaft of what I think is a sort of varister behind the front panel. I glued it back together with Gorilla Super Glue and it held for awhile. My selector switch also came off. I'm going to have to order a new varister for the main tuning knob from Yaesu. Why they decided that a plastic, threaded part would go well with a heavy metal shaft would be a good idea, I'll never figure out.

Ken:

Yes, they all do have microprocessors in them, but that's considerably different from a computer with an operating system and drives. Even in those cases the only damage should be minor issues with incomplete disk writes and not actual physical damage to the equipment. Dedicated microprocessors are often expected to see power disappear at any time and are coded to ensure that this doesn't cause problems. In fact, circuits that route power to microprocessors are often simply switched.

Looking at the FT-897 drawings, it looks like power to the microprocessor and associated circuitry is simply switched by a device off of the 13.8 V bus and there's of course a regulator and considerable power-up control circuitry and filtering. On the PA board there's good input power filtering and both switched and unswitched 13.8 V busses and several devices that detect DC input power. It's clear they were anticipating a possible loss of DC. So far I'm seeing nothing that would be a problem, but again if you find anything let me know.

I'd also suggest that there's considerable experience with low-voltage conditions as many 897 owners have run their rigs off of battery power, both internal and external, including myself. Never have I heard of a depleted battery condition damaging one of these radios.

What I'm getting at here is that it's common to simply switch station power on and off to power up and down a complete station. This is a normal and good thing to consider doing, both in mobile and fixed installations. I've never heard of any such cautions about power with communications equipment in the many years I've been in communications of various sorts. Frankly, if we listed to all of the odd thoughts of "Elmers" in this hobby we'd be shaking chicken legs before every transmission. (sorry)

It was designed that way on purpose. When any of the knobs gets a substantial "bang" sideways, the shaft breaks. That way, the component (which is expensive) on the PC board is protected from damage. New shafts are available from Yaesu and are relatively inexpensive. I've been very careful, and it hasn't happened to me - so I don't know from experience - but that's the story I've heard.

difference between communications gear and some other types of

electronics, such as computers. In general though, if things tended to

break when there's a power outage, we'd have some major class action

lawsuits.

In the case of communications equipment, it's common for them to have

power dropped without first using the power switch on the radio, either

by disconnecting a cable or by turning off power supplies. As I've asked

before, if someone can find a reason that some piece of communications

equipment would have a problem with that (a specific case), I'd be real

interested in hearing about it.

With the 8900 plugged into a regulated power supply or wired to the car... Is it safe to simply turn off the power supply or car to shut down the radio and turn on the power supply or car on (with approh appropriate surge protected autoswitch from anderson).

Or MUST one always power down the radio before the external power down and the reverse to power up.

I am concerned that my kids may forget and simply turn off the source power.

Dear

I'm an onwer of a FT897D. For now I'm getting high levels of noise about S7-9 on all HF bands plus 6 meters. No matter what of DSP combinations I'm using.

I've tested it with a swchited power supply and a linear one with no goods results. Could somebody explain or give me a tip to make it work as a normal HF radio in terms of excessive noise?

Thank you

Subject: [FT897] New FT-897D, need antenna ideas

With the FT-897D I wanted something portable. I went with the Ventenna Companies HFp http://www.ventenna.com/ . I can take it along just about any where. When I take the motor home out, it comes along with the FT-897D. When we get to where we are camping I set up the HFp. I purchased the vertical first and added the dipole kit later. I like to use the dipole on my patio. I put the painters pole in an old umbrella stand and set up the HFp from 6-20M.

A local club here in Sacramento had the Ventenna Co. do a presentation last week. They had a vertical one set up on 40M. First contact was on CW to Mt Vernon, Virginia. They had a 20M dipole set up and heard both U.S. stations and Australian stations. They tried to make contact on 20 meters but ended up having a bad connector on one end of the coax. I have used the 20m dipole with good success.

You can check out reviews on e-ham for all antennas. Here is the link for HFp reviews. http://www.eham.net/reviews/detail/2737

31030. Color Display Settings

Yahoo group: FT897 (2010)
Date: 2010-08-25 03:38:24 UTC
From: kf6wtc
Topic: 31030 Message: 31030

Hello. I am a new FT-897d owner. I've pretty much have learned everything there is to know about the settings menu on this radio. One snag I have run into is on the display menu No 41. This setting is default on FIX:. The instructions say to press the MEM/VFO knob in to have it selected the "FIX" portion of the setting. Then rotate the VFO knob to change from FIX: to the option I want. Well I want MTR:. So I rotate the VFO knob to MTR:. Then I press the MEM/VFO knob in again and it goes back to the number selection again. At this point I rotate the VFO knob again and it changes from 1, or 2, but that's it. Am I miss understanding the instructions when I think it tells me I can choose what colors I want, or am I just stuck with the colors that show up when I either use selection 1, or 2? I can't seem to figure out how to choose from the 30 something colors that are available in the FIX: option.

Basically I am trying to set the radio up in the MTR: setting to show blue on receive, but change to red when I tx.

Thanks in advance!

Evidently you missed something in my original message, so I'll quote it here. The last sentence is the relevant bit:

> > Anything with a computer in it can have that memory scrambled,
> >for example, so even if you don't explode the equipment, you may
> >cause it to lose its programming or slightly alter that
> >programming in unusual ways when that initial spike of voltage

> >This is the most common issue I've seen in recent years with
> >amateur radio gear and power-supply cutoff. I've specifically
> >seen this happen on my own FT-897, and have had to hard reset it
> >once as a result.

However, since you asked:

- I have seen dozens of computers in varying states of disrepair as a direct result of power-cycling by breaker or unplugging
- I have seen televisions actually explode and fry from that kind of power cycling. In fact, the last device to do this was a monitor on my desk at work a few years ago. Workers playing with the power for some other thing, my monitor plugged in and on while this was happening, bang!
- As noted, my own radio has been scrambled requiring a reset by power cycling at the supply while the radio was on. This has also occurred on my FT-847, my Kenwood D-700, my Kenwood D-710, and my old Kenwood TM-732. The last three are/were in the car.
- I volunteer at the Canada Museum of Science and Technology amateur radio exhibit. I've seen the Icom 880 weird out due to shutting off at the breaker, and we've only had it for a few months.

For reasons, I can only conjecture. In the case of computers, I suspect it has something to do with voltage spikes when the power is reapplied.

For the scrambling memory and programming, I would guess that the decaying voltage while the device is still running can hit a point where some of the internal processors recognizes the state one way, while other processors recognize it another way. In effect, the device gets confused.

It doesn't happen all the time. It doesn't even happen often on any given piece of equipment, but it seems to be unpleasant enough that I make an effort to avoid the situation.

Unfortunately most of what you say makes very little sense.

For example a lot of TVs have mains switches that just interupt the mains supply, so what is different to switching the 'breaker'?

Computer supplies are never actually off until the mains is removed, so re-applying the mains is normal operation!!

Ture there can be ill effects if the mains is suddenly removed but that is usually down to file corruption if a disk write was in progress when the power dies.

U think that there is a lot of scare mongering goping on here, most of which has little basis in fact.

Actually what he says makes complete sense. The power down sequence for many electronic devices is of some importance. I too have seen my FT-897D require a reset after an accidental power loss and have also seen one 'scramble' when I kicked the power cable out of my 880.

While the consequence is unlikely to be permanent damage the need to reset and reprogram something like the 880 while operating mobile is quite a chore. Certainly there is little reason to risk the potential aggravation - just pay a little attention to what you are doing.

All that said, we all connect our mobiles directly to the battery like the manufacturers specify, don't we? I mean, do you think they just needed to fill up a few more pages of the manual?

John, All

I live in an Urban area, I tried my FT-897D with my three Antennas:
R-5 Vertical very noisy S7 level on all bands.
The two element beam (ButterNut)noise level S meter 0
Inverted Dipole for 80-40m noise level S meter 0
I still hear the atmospheric noise depending on propagation conditions
with no reading on the S meter for the Beam and the Dipole antennas.

Ted:

Yep, always connect my radio equipment to the battery, but switch it through a 50 Amp relay so it goes off with the acc line. I frankly think there's more likely trouble from forgetting to turn off a radio and not being able to start your car (or damage your battery) than dropping power to your radios.

As to the other electronics, I think most of the rhetorical information about failing electronics, particularly computers and TVs, is due to the bad capacitor chemistry fiasco of the 90's that's still plaguing equipment today. I also have not made any reference to a situation where someone is intentionally or otherwise rapidly switching power on and off as has been implied as a source of possible damage. That is clearly not a good thing to do.

In any case, I think this has all run it's course. Again, do whatever makes you feel good.

Rather than connect my radio directly to the battery, I found a spare (unswitched) slot in the car's fuse block (under the dashboard) and installed another ATC fuse there, and then ran power from there (both leads) to the radio in the rear of the car. I'm curious as to what you think of that? I like it very much because I think it's a cleaner and easier installation, and the fuse is out of the engine compartment.

As for having the radio unswitched (by the ignition) and accidentally leaving it on, most radios these days have a "no operation" timeout that you can set. Not setting that on an unswitched radio is asking for a dead battery.

Dean:

It all depends on what you get out of that fuse block terminal. If it's tied to a good high-current line and there's minimal voltage drop under load (while transmitting) it may very well work fine. The only concern other than that might be the total current the line feeding that terminal is handling and weather it's still within a good working range for the gauge and the terminals supplying it. You certainly don't want to start heating wires or connectors in your car's harnesses. If you can determine all of this, and the radio is happy with it, why not.

When you say "both leads" are you saying that you're running both battery power and ground from the area of the ATC fuse to where the radio is located? If that's what you mean, consider that there's two implications of this. One is that if you have no other grounds tied to the radio (antenna ground or radio mounting) that your total voltage drop to the radio is the sum of the drop on both the plus and ground leads. If you do have other grounds tied to the radio, be sure you're not encouraging other vehicle ground currents to follow your power ground lead. In most cases that's not much of a concern because the vehicle chassis is a pretty good conductor, but there are scenarios where that can happen (i.e. tying the power lead black to an engine ground and then having an engine ground strap probelm--start car, lots of current--not a good thing to happen).

Yes, many radios do have automatic time-out functions. The problem with that is that they don't come back on automatically when you get back in the car and start it. This is actually one of my worst problems with radios that aren't switched automatically--I forget to turn them on and miss important radio traffic.

Other types of installs I've done in various vehicles have included a secondary battery near where the radio body is located. If you have space and need a bit more current (running an amplifier or something) it's a good way to go. When I've done this I've run a charge controller that manages charge on the secondary battery, but that won't allow the starting battery to be drained by the radios. It's a great way to go, but again you can damage the secondary battery if you forget to switch the radios off so a relay is still a good idea.

Rather than connect my radio directly to the battery, I found a spare (unswitched) slot in the car's fuse block (under the dashboard) and installed another ATC fuse there, and then ran power from there (both

leads) to the radio in the rear of the car. I'm curious as to what you think of that? I like it very much because I think it's a cleaner and easier installation, and the fuse is out of the engine compartment.

As for having the radio unswitched (by the ignition) and accidentally leaving it on, most radios these days have a "no operation" timeout that you can set. Not setting that on an unswitched radio is asking for a dead battery.

It won't work that way. The color selection is only for the
background color. You CAN, however, select a different color for
different bands and have that saved so when you change bands you will
have a different color to indicate such without having to look at the
frequency that is displayed.

Would be nice to do what you suggested, but it wasn't designed that way!

See my http://www.ae7q.net/doc/public/FT-897D.php

Note that selecting a color is a little confusing; you have to press
the MEM/VFO knob to make a secondary selection of color.

Well, there are whole bunch of other fuses in the fuse block:

6x 5A
10x 10A
8x 15A
5x 20A
2x 25A
2x 30A

So, while I realize that not all of those fused components are drawing significant current at the same time, I'm hazarding a guess that the feed to the fuse block is adequate ! The power run from the fuse block to the rear of the car is as short as possible (about 6ft), and is 10 gauge. The drop at the radio when I transmit with the engine running is from 13.9v to 13.2v.

Note that the radio is an Icom IC-2820H, with a 50W FM transmitter (rated xmit current draw is 13A). My FT-897D is in the house !

> When you say "both leads" are you saying that you're running both battery power and ground from the area of the ATC fuse to where the radio is located?

Yes, to a electrical ground point on the car frame where other electrical items are grounded (like the car radio). I considered running the power ground from the radio to a grounding point in the rear for slightly less voltage drop, but liked the "cleanliness" of my present arraignment, and considered it might be less of a source of noise problems.

> ... If you do have other grounds tied to the radio, be sure you're not encouraging other vehicle ground currents to follow your power ground lead. In most cases that's not much of a concern because the vehicle chassis is a pretty good conductor, but there are scenarios where that can happen (i.e. tying the power lead black to an engine ground and then having an engine ground strap problem--start car, lots of current--not a good thing to happen).
>

I'm well aware of the problem of providing an alternate ground path to
the battery, and it's one of the reasons that I'm not in favor of
connecting the ground lead to the battery. If the connection from the
battery to the frame is inadequate, that needs to be fixed for a bunch
of reasons.

> ... [Radio timeouts are] actually one of my worst problems with radios that aren't
switched automatically--I forget to turn them on and miss important radio traffic.
>

For me, there is no such thing as "important radio traffic", when I'm
home or in my car. In an airplane, that's another matter, but turning
the radio on is pretty hard to forget !

> Other types of installs I've done in various vehicles have included a secondary battery
near where the radio body is located.

In the rear of the car where the radio is mounted, I also have connected
an old Tripp-Lite 500W inverter/charger, which I plug in and run in
charging mode whenever I'm testing the radio without the engine
running. It will also charge the car battery pretty quickly if necessary.

31045. No CW tone when I tune

I usually use the CW mode to tune the tuner, amp, etc. As luck would have it,my main rig is in the shop due to the sideband going south. I use the FT 897 as a backup rig, and sure enough, there is no CW tone when I turn over to CW and hit the mic key.

Anyone else have this problem?

Thanks

Many trucks and vans come with a trailer harness installed and a trailer brake harness under the dash
to hook up a brake unit.
On my Dodge it comes straight from the battery thru a 40 amp fuse in the engine compartment and into the cab.
A brake control cable plugs into a plug under the dash. The pigtails are available to power my radios.
The harness continues to the rear hitch. Power is also available there.

The mic is not supposed to work in cw unless you change the main menu item from normal to MICKEY and then the up/down keys act as a paddle does, otherwise you need to plug in a straight key in the back of the rig or tune in AM and use the mic's ptt.

>

There is a huge difference in both those cases.

If the mains are left on, but the device's power switch is turned on/off, the voltage coming from the power supply is stable and correct.

If the power switch is left on and the breaker is cycled, the device is subject to the whim of the electricity that comes out of its power supply as the voltage builds in the transformer as electricity is applied. It's not instantaneously perfect. As you are certainly aware, this is not a polite ramp-up from zero but can be spiky and uncertain. The spikes can be quite large and can exceed the design limits for the internal circuitry on the device.

> Ture there can be ill effects if the mains is suddenly removed but

>

Honestly, I don't think there's enough scare mongering on this matter. It's important to use a device as intended to ensure its long and proper functioning. Just because someone has found a way that works sometimes, even most of the time, doesn't mean it's a good idea.

31052. Re: FT-897D transverter mode ..

Yahoo group: FT897 (2010)
Date: 2010-08-29 06:45:28 UTC
From: colin.bell99
Topic: 31029 Message: 31052

WL7COL ???,

I do not currently use any type of transverter but I have been investigating using a Transverter to get on to 4m (70mhz).

As to 'is it a good idea to take Yaesu up on their feature'. You are going to go into the homebrew area, even if you buy ready built equipment, since you will have to cable it all up yourself and set up the FT897 to supply the correct input/outputs, so (if you are like me) you will be doubly checking everything and generally taking great care. It is highly unlikely (unless you cable something up incorrectly or you have self designed a transverter and got it wrong) you will break the FT897.

You specifically mention 1.25m, 23cm & 13cm. I would not imagine there is anything specifically different in the methods for these bands, just in the circuits themselves.

As I understand the FT897 menu settings, transverting from 28mhz, with all connections made, you would (say for 1.25m) set the menu no 89 to 222000 (khz) set VFOA to 28mhz and then select XVRT A. Your VFO display should now read 222mhz. When you tune up to say 222.5 on the display you should receive any transmissions audible on that frequency and if you transmit you will transmit on 222.5mhz.

You would need to be careful about going out of band and if the band spread is greater than that of the 10m band (we don't have 1.25 in the UK) you will find (unless you have been tweaking with the FT897) that you won't be able to transmit on the upper portion of the band.

When I was investigating I did an internet search on Transverter and came up with about 13,000 hits including some specific to 222mhz transverters.

Hope this is not to simplistic for you. Good luck with your investigations.

HRD is capable of being configured to use 4800 baud, although I am not sitting in front of that computer right now, so I can't give you explicit instructions on how this is done. I plug the cable from the computer's COM port into the spare CAT receptacle on the tuner, and then use the jumper to connect the tuner to the rig. I also had to set either DTR or DSR, if I recall. But, I use my FT-897D in conjunction with both HRD and AT-897Plus regularly with good results. The only real problem I've encountered is that the tuner doesn't seem to like it when I turn on the rig while the HRD program is already up and running. In this case the tuner often cannot initialize correctly and won't stop blinking an error until I've shut down HRD and power cycled the rig. Also, occasionally, I have to hit the tune button twice if there is HRD CAT activity going on at the time which causes a conflict.

4800 baud is fast enough for HRD. I'm not certain, but I'd suspect it also provides a bit more immunity from RFI on the CAT cable than higher baud rates do.

If you read the Operating Manual, Page 35 under Transmitter Operation, you will find that you need to change to FM and then press and hold the "HOME" key. I would also suggest that you lower the power to 5 for the meter's first setting and then increase it to 25 for a second test. Do not forget to reset the FM to LSB or USB and power to 100 before you attempt to transmit.

Go to the operating Manual, page 35. Lower the power to 5 and change to FM. Push and hold the HOME button and you will get a tone for tuning. Once you have the signal tuned, you can raise the power to quickly test again. Do not forget that to transmit, you will need to set the FM to USB or LSB. It is kind of a back door to have a tone to tune.

31059. Re: High QRN/M levels

I believe I can help with this one. I was suffering the same issue, and googled high and low for answers to the high noise floor on my 857D.
It turns out that you need to enable from the menu "IPO". This disables the receive preamp, and fixes the issue. It does not affect signals, well they may drop a fraction, but the constant S6-S9 noise floor vanishes.
Press the MenuF button till you get to row M and press button A. An I will appear on the screen. This is to be done for each band you wish to disable it for, and on both VFOs.
The manual states that it is not good to use it below 10MHz

Hope this helps

Hi all!

I'm a new Ham and I'm interested in purchasing a FT-897D since it looks like an all-around great radio.

I was hoping to get some advice from you all about where/who to buy from, and any suggested accessories and antennas I should pick up, or any general Ham advice at all!

Also, I'm in Fayetteville, NC if that helps :)

Thanks in advance!

From: bw3us
Topic: 31061 Message: 31063

There's quite a bit to answer in your question William.

I've run the 897D for years and find it's a good, general, radio.
Prices are about $900 for a brand new one, but they can be found on
eham, qth and qrz in good condition for much less.

Antennas is another answer which is difficult as what room do you have?
Verticle? (noisy), DX, local repeaters etc all come in to play.

Check your local ham clubs and find one-on-one answers. NC has a lot of
clubs and the hams there will be glad to point you in the right
direction.

Good luck and welcome aboard.

From: Chip G.
Topic: 31061 Message: 31064

I own an FT-897D, and it's twin sister the FT-857D. Great radios.

Antenna: depends, a lot.how much space do you have? How much money? What do you want to do with it? Are you looking to just do base operations or also use portable? Assuming you aren't loaded enough to go for a full tower, rotator, and beam right now... If you have a couple of trees that are about 150' apart then a G5RV or some other long-wire antenna is a great option that doesn't cost much money but performs well. If you are considering portable ops than you might consider a Buddipole, one of the best portable antennas (and can also be put in service at home to great effect). Of course a long-wire can also be used portably.

Accessories: if you are going to go portable, then get a battery and charging cables. Depending on the antenna you get it may be worth getting a tuner to maximize usable band space. (Any antenna optimized for one band/frequency will not perform well on other band frequency. The tuner allows you to use the antenna where you wouldn't be able to otherwise with a sacrifice of some efficiency, i.e. lost power.) later you can add digital to the mix. There are lots of ways to do this, but my favorite involves the NUE-PSK modem. You can have lots of fun with accessories, but really there are few you NEED right out of the gate.

General advice: start slow. Build up. This is a hobby you can enjoy for the rest of your life, you don't need to do it all right away. Save your pennies and consider the next step. Enjoy what you are doing now but also dream of what you will do next. One of the greatest wonders of our hobby is the breadth of modes, abilities, skills, and talents you can develop in it.

From: Stew KD5LBE
Topic: 31045 Message: 31065

From KD5LBE There should be a tone in CW or FM is good but turning the power down as far as it will go and not holding it very long is really important until you are close. If you don't you will have two radios in the shop. There is nothing wrong with keeping the power low it won't hurt the radio, you just won't find yourself talking to a lot of other HAMS.

Subject: [FT897] Re: No CW tone when I tune

If you read the Operating Manual, Page 35 under Transmitter Operation, you will find that you need to change to FM and then press and hold the "HOME" key. I would also suggest that you lower the power to 5 for the meter's first setting and then increase it to 25 for a second test. Do not forget to reset the FM to LSB or USB and power to 100 before you attempt to transmit.

Congratulations on becoming an Amateur Radio Operator!

I like my FT-897D. It covers a wide range of the ham bands. I have the SSB filter installed. I would recommend it highly.

I use an external power supply. I feel that it keeps some of the heat of the radio. But the internal power supply would work fine. You need one or the other.

You will probably need some kind of tuner. I have the matching Auto-Tuner. It plugs into a multipurpose socket on the back of the radio for its control signals. This socket is also for the CAT (computer) control interface. I do not use this tuner because I have an Ameritron 600 watt solid state linear amp hooked up. It also interfaces to the same socket. I use an external 600 watt auto-tuner.

LDJ make an autotuner that interfaces to the 897's CAT port and provides another CAT port for computer control.

The CAT signals are also available on the microphone connector jack on the front of the radio. I use the Yaesu desk mike and plug the CAT cable into a spare RJ45 jock on the back of the mike.

The antenna output is split between HF + 6m on one antenna connector and 2m/440 on the other.

A dipole of some sort is the way that most new hams go for the HF side of things. I use a 80m dipole and an G5RV. HF signals are usually horizontally polarized.

I use a diplexer to separate the 6m signal from the HF so that the 6m signal can go to a vertical antenna.

Most 2m/440 work will require a vertical antenna. A dual band type is the way to go. You can build a simple J-Pole or ground plane antenna. These two signals usually are vertically polarized.

I use the CAT control and a SignaLink USB (soundcard) interface for digital communications - mostly PSK31. The CAT interface is from Yaesu. It cost about $50. It comes with software that

lets you use a computer to program/backup the radio settings. I use Ham Radio Deluxe for controlling the radio for PSK31.

l don't know how close you are to the Shelby NC Hamfest. You will find EVERYTHING ham related there. It is coming up in a few days - this weekend! see http://shelbyhamfest.com/

All of the major vendors will be there (sometimes with "special" pricing) Even if you do not buy anything, you can put hands on almost everything. And gather catalogs/information/brochures/etc. My wife calls those "Wish Books".

You will need to have a good grounding point for your equipment. I use grounding switches for all of my antennas. They disconnect the radios and ground both the radio and the antenna. I have very good surge protection installed on the power feeds to my gear.

Online, Ham Radio Outlet http://hamradio.com/ , http://www.gigaparts.com/radioindex.php, Universal Radio http://www.universal-radio.com/catalog/hamhf/0897.html, AES Ham http://www.aesham.com/, Ham City http://www.hamcity.com/store/pc/home.asp are reputable dealers.

Stay away from eBay unless you are sure of what you are getting. There usually are no return policies there.

And most of all - HAVE FUN!

73

31068. The LDG AT-897 Plus Tuner

Yahoo group: FT897 (2010)
Date: 2010-09-01 00:30:45 UTC
From: scotchmandr
Topic: 31068 Message: 31068

Regarding The LDG AT-897 Plus Tuner.

The site states the following:

"The tuner has a front panel button to initiate the tuning sequence while lowering the RF power to 25 watts"

Does this mean if I have it turned down to say, 10 watts for operation in my tent with an antenna off of it's back, does it then actually turn the power UP? Or will it tune at whatever power setting I have the TXCVR at already if under 25 watts and only lower it to 25 if it is greater than that.

Lets say I have my 897 turned to 5W for some QRP... Will it turn UP to 25W to tune? This would not be good if I am using a QRP antenna rated for 10W max.

73,
Phillip (N8AYE)

> Lets say I have my 897 turned to 5W for some QRP... Will it turn UP to 25W to tune? This would not be good if I am using a QRP antenna rated for 10W max.

I have no inside knowledge of this but, based on what I've read, the AT-897Plus tuner saves the current mode, then puts the rig in AM mode, and then keys the transmitter. When done, it restores the previous mode. You can verify this by watching the display closely and seeing the transition to AM and back. In AM mode, the carrier is theoretically always 1/4 the RF power set in menu 75. Thus setting the RF power control to the max would result in a carrier of 25W, and it is this carrier which is used for tuning. Decreasing the max RF power should also decrease the 25W carrier linearly, and empirically it does decrease the carrier, although on my wattmeter it is not all that linear. But, tuning up with the max power set to 5W will result in something less than 5W of available carrier to tune with.

Note that while the tuner is in the process of tuning, the rig is essentially transmitting an AM signal, so anything you say that is picked up by the mic goes out over the air.

Hope this answers your question.

Rob / KD8WK

31071. Tapping PTT makes receiver recover sensitivity.

Yahoo group: FT897 (2010)
Date: 2010-09-01 10:40:10 UTC
From: agodney
Topic: 31071 Message: 31071

When receiving on 2 meters FM on my FT897D the "S" meter will, once in a while, drop about 4 "S" points, if the signal was say signal strength 5 then the noise also increases. If I transmit for a brief period the receiver will recover and indicate signal strength 5 again and the noise decreases. This is similar to the older type of radio when the antenna relay contacts were dirty. The FT897D has a diode switching line that controls the antenna. I have not noticed this fault on other bands but I really only use 2 meters constantly at present.
I wonder if anyone else has experienced this problem and how they fixed it.
Thanks Allan M0CBG

Yes, try it and see but I don't recommend using the 10 watt antenna for the test. Use an appropriately rated dummy load or antenna rated for at least 25 watts.

One consideration however, I do not know if the AT-897 tuner remembers settings as does the SCG SG-230. If it does, and you test it with a different antenna on that frequency, the SG-230 remembers the previous setting and goes to that but will retune if the SWR is above a certain level.

> When receiving on 2 meters FM on my FT897D the "S" meter will, once in a while, drop about 4 "S" points, if the signal was say signal strength 5 then the noise also increases. If I transmit for a brief period the receiver will recover and indicate signal strength 5 again and the noise decreases. This is similar to the older type of radio when the antenna relay contacts were dirty. The FT897D has a diode switching line that controls the antenna. I have not noticed this fault on other bands but I really only use 2 meters constantly at present.

Found this don't know if this will help

It's possible to make a relay cleaning, of the Yaesu FT-897 transceiver, by pressing the "DWN" and "UP" keys simultaneously and turn ON the transceiver.

31077. Tuners? FT-meter?

Yahoo group: FT897 (2010)
Date: 2010-09-02 19:39:15 UTC
From: mstarmer1
Topic: 31077 Message: 31077

Well I am looking at tuners to make life easier. I see the AT-100pro is nice with built in meters, the AT-897 is a good bolt on and the YT-100 seems to be a bare bones Yaesu tuner.

Each has it's appeal but I kind of like the AT-100's ability to work with any radio, I like the bolt on AT-897 for portability.

This would be my first tuner to be used with my SuperAntenna. I could get the 897 and the FT-meter to make things easier to see I guess?

Suggestions??

31078. Re: Tuners? FT-meter?

From: Hank
Topic: 31077 Message: 31078

Well I have the AT-897 and love it. My 897D is my only HF rig so I don't need a tuner for another radio. Because of that, I chose the AT-897. If I had another HF rig I might have chosen the AT-100.

I also have the FT-Meter, and what a difference. To me it is just so much easier to read than the built-in meter. I can glance at it and instantly know how I'm doing.

Only other suggestion I have is a desk mic. I have the Yaesu MD-100A8X and get wonderful audio reports. If you choose to get this mic, you MUST make sure that the processor switch on the bottom of the mic is in the bypass position. I missed that in the brochure that came with the mic and was getting horrible reports. I emailed Yaesu, and they didn't know what it could be. I re-read the sheet and saw where it said that the FT-897 and a few other radios must have that switch in the bypass position. As soon as I set the switch correctly, people noticed a big difference.

I have the LDG Z100 plus. It works great. Not bolt on but very small in size. Connects to data port.

I ruled that one out after reading this on W4RT's website;

NOTE: Not for use with FT-857(D) or FT-897(D) if you plan to use VHF or UHF. These two radios transmit a small amount of VHF/UHF RF energy out of the HF port and will fool the tuner into tuning. Use the AT-100Pro in this case.

After reading all the eham reviews it sounds like most of the LDG stuff is good, it's just a matter of aesthetics and options.

Hey Ken,

that does solve a lot of HF problems... have used it myself, but it
wont affect
2m or 70cm as there are no relays in the TX or RX paths on those bands :)
its all diode switching

cheers

I have tried this, but it did not fix the problem. I run two FT-897D made in different years and they both do this very consistently on all the bands EXCEPT VHF and UHF. They did this at the home QTH for a couple of years and when I was QRV in Iraq as YI9VDW for the last year. Just got home a couple of weeks ago and resetting up the HF towers and antennas yesterday and today. I have tried mutiple power supplies, batteries, rf grounding and ferrite chokes etc. thinking that were the problems too - they were not. I'll let you know if this continues...

I'm puzzled about both these posts.

I also use an LDG Z100 plus but have no data port connection. I have to connect to the ACC jack.

I cannot find any comment on W4RT's web site about the Z100 connected to the FT857/897 auto-tuning when using VHF. I was not aware the Z100 could autotune. Unless RF is causing the microprocessor to activate a tune it is normal to tune via the push button on the front. I have not had any trouble so far with my Z100 and it seems it can match the proverbial damp string.

Okay, so I FINALLY get some vacation...get a few minutes to play with the radio. This is an FT-897D with the FT-30 power supply, an LDG-897 tuner hooked to a G5RV-jr. Have had NO problems with this setup at all for 6 months.

Earlier today I was on a 2-meter repeater, and this evening jumped on to try an HF contact (haven't had on in a while). Was unsuccessful a few times, switched over to 20 meters, tuned up, found a free frequency and tried a CQ call.

The radio shut-off (powered down completely), then in a second or two powered back up with a pink screen and what appears to be all settings lost. All memories are gone, even the simplest settings seem to be erased.

On the positive side, I can hear stations on HF so the receiver is working.

What the heck just happened? something trigger a complete reset?

I searched the forum but did not find anything on this. Oh boy is this going to be a pain to try to get all those settings back!

Well...on the positive side...as I reset the settings (started with a local FM repeater) the radio appears to be working. Haven't tested on HF yet. Looks like the radio went through a factory reset. Not sure why.

I'm new as a HAM and this radio is new to me as well.

I have the CAT cable but I don't have any software for imaging the settings on the radio. I see a few software packages on Google for this purpose but would appreciate any recommendations.

Thanks.

Peter -

As a point of interest, there has been some issues with the LDG-897. Most reviews have been positive, but a few may relate to the problems you are having:

http://www.eham.net/reviews/detail/3265

We bought a LDG YT-100 for use on Field Day. It performed flawlessly. However there is difference in price...It's worth it.

http://www.eham.net/reviews/detail/8322

Maybe try it with low power.
Guess the RF shouldn't be there when using 5 watts.
Also try without turner.
The autoturners for the FT897 are nice,but you are not able to bypass it.
I have no autoturner but a MFJ-949D...
I never use it,my antenna's are good enought,the worst SWR is around 1:2.0.
Maybe you get the RF from the small kabel between radio and Turner.
I would try the radio on low power and also without turner,see what happens
then.

Good Luck.

31097. Laptop interference

Yahoo group: FT897 (2010)
Date: 2010-09-07 10:33:27 UTC
From: KB1TCD
Topic: 31087 Message: 31097

Hi all.

Our shack is on the second floor, which poses a grounding problem of its own. To address this we bought an MFJ-931 Artificial Ground, which has helped a lot, especially on our Eagle GAP vertical antenna on 20 and 30m and on 80m on the Alpha Delta Sloper antenna.
A couple of weeks ago I got a Dell Inspiron 1501 Vista laptop back from my daughter, it has an aftermarker charger that actually won't charge the laptop but keeps its running. The Systemax XP pro laptop I was using has a hard time keeping the wireless connection going in the shack, so I switched it w/the Dell.

Been doing a lot of digital as of late and noticed that conditions where deteriorating fast.
With hurricane Earl, which was a non-event here in Maine, I had disconnected anything Friday before we left the house.
Re-connecting Sat morning I tried voice on 20m, made a DX contact straight away, when I proceeded to hook up the laptop, everything just about dissapeared into noise. Unpluged laptop, back to normal.

Noise the same on both HF rigs, the 897D coupled to an LDG 897 tuner and the Kenwood TS-520.
We have a similar Dell laptop, used it's charger and everything is back to normal.
Doesn't matter where in the house we plug in the after market charger, unbearable noise returns.
I have ordered a Dell charger and unplug the laptop while working stations for now.

So, warning, if anyone has a Dell laptop, avoid getting an aftermarket charger, apparently a lot of them won't charge as Dell laptop won't recognise the charger, and they make radio life unberable.

From: Hank
Topic: 31087 Message: 31098

Jose,

I will take your great advise one step further. When ordering a replacement charger for your Dell laptop, make sure you order the exact part number. I have found that not all Dell chargers will work with all Dell laptops, even if the voltage, current, polarity, and plug all match. Sometimes they work, sometimes they will power up the laptop but not charge (like yourself), and other times they won't even power the laptop up.

From: davekh@cix.co.uk
Topic: 31087 Message: 31099

Hi Jose
I had a similar problem but mine was from a TFT Dell monitor - I noticed mine when I began to use a 50mhz beam which was
on a mast close to the room the radio is in - when I went out and pointed ther beam over the room noise when up - more
so on 50mhz than other frequencies, but certainly is all over the place one HF and even upto 2meters.

Just moving the monitor further away from the radio helped- its not so bad on HF as to stop contact, but very very weak
stations on rtty and psk are effected by it. I try to log 6meter contests on paper to save the problem now.

Does the noise show up on your waterfall as lots of lines?
What kind of interface are you using (if no interface it may be better to use one to separate the laptop circuits from
the radio).

I don't use the artificial ground - but maybe moving that away or nearer may help - or try moving the aerial coax and
interface leads around as well - you might reduce it that way simply first?

Jay,

Thanks for the heads-up. I gave a quick skim of the reviews (I had read them before buying it) but did not see anything at first glance that looked like what I have happening.

However...

One of my first thoughts when the radio reset was that I needed to take a close look at the tuner.

The tuner has functioned flawlessly thus far. Of course, that isn't proof positive that it didn't flake out all of a sudden.

I'll keep that in mind.

For the time being, I am going to try going back to 20 meters and reducing power and see what that does for me. I just don't know what conditions can trigger a reset (short of the manual input sequence).

My ground outside appears to be intact on my grounding rod, so I am puzzled.

However, someone mentioned maybe RF in the shack. Well, the antenna passes along the opposite side of the wall where the radio is. However, after 6 months of operations with no problems, I re-oriented the antenna in such a way as to actually put MORE distance between the pole and the house. Now this happens. Really weird.

Well, I guess I get to investigate this. Too bad I was looking forward to the first time I'd have time actually USING the thing with lots of time.

Alas, hopefully I'll come out of this a bit smarter about how the equipment and antenna all works.

Thanks again for your input.

Is this a common thing (RF feedback resetting the radio)? I've never heard of such a thing before. I mean, RF in the shack causing problems...yeah...but resetting the radio? That seems awfully...well...deliberate.

Are these radios build/programmed to reset upon large RF fields close by?

Thanks.

From: KB1TCD
Topic: 31087 Message: 31104

Dave,

The laptop itself is not causing any problems, if I disconnect the charger, everything behaves properly, if I use the charger for our other Dell laptop it behaves fine as well. If I use aftermarket charger on either the laptop in the shack or the other Dell laptop anywhere else in the house, I get noise on voice as well as on the waterfall as steady blue covering the waterfall.
Aftermarket charger is random, btw, right now it's charging the laptop, most of the time it will not.
Laptops do freeze up at times if I'm transmiting on 80 metres and try to move the mouse.
Perhaps what I need is an exorcist...
The antennas ARE too close to the house, in fact they are attached to the side of the house and I have all my coax up in the attic then going down to the shack from there. I realise that having antennas too close to the house can cause problems as well.

Digitally I usually do Olivia 8/500, MT63-500, and MFSK-16.
Also do a lot with Winmor RMS (Winlink)

I use a Signalink USB, the FT-897D and the LDG AT-897 Plus tuner.
The MFJ-931 Artificial Ground is attached to the LDG tuner and a counterpoise wire of about 160 ft is spread out over the floor of the shack.
For voice we also use a Kenwood TS-520 w/tube finals.

Our Alpha Delta DX-B sloper is not supposed to work w/o a capacitance hat, but the counterpoises on the GAP Eagle vertical seem to be serving as a cap hat of sorts.

Cheers!

Peter -

If the tuner is having a tough time seeking and finding a match, or under higher power, the match changes due to heating in the tuner...You might develop RF in the shack which would cause problems.

The feeling that I got was that YT-100 was a better built unit and gave a better performance under conditions of High SWR. Under all conditions a good ground is a must.

Bad RF or power. Could be the jumper coax, the antenna, the power supply... or a combination. You didn't mention if you were using a diplexer or if that was attached properly.

My AT 897 had loose so-239's on the rear panel. Had to removed cover and carefully tighten them.. but no bad experience since then.

I would suggest trying HF at very low power and working up .. carefully watching SWR [on 897 panel if no meter available]. Anything over 3:1 will generally cause a shutdown.

PS-- I do assume you are using a powerful-enough power supply. Inadequate amps would also cause the same type of problem.

Good luck and be careful. I blew out my finals once as new ham by not carefully checking all the cables and watching the SWR.

31107. Re: [FT897] Re: What the @#$% just happened?- SOFTWARE

Yahoo group: FT897 (2010)
Date: 2010-09-07 19:51:11 UTC
From: Stanton Royce
Topic: 31087 Message: 31107

Regarding your question about software for FT-897D, there are two types, programming/ set up and operation/ control.

For programming, I'm using ADMS-4B with the USB cable. It is important to read the software use instructions because the default mode for the software is to ONLY REMEMBER FREQUENCIES AND NOT SETTINGS which are different from default FT-897D settings. That means if you have a radio reset all this software will help with is restoring freuencies in memory, not other radio settings. You have to click a box in the software if you want it to remember radio settings. The down side of remembering settings is, there does not appear to be a sync option, either what is in the software on the PC over rides the xcvr or visa versa when you do a data transfer. When you read the software set up instructions this will be clear to you.

For operating software, I started with the free Ham Radio Deluxe, continue to use it and have not tried any of the other operating software. You can search online for "ham radio software reviews" to learn what are your options, or maybe others here will teach both of us something about this!

Well...on the positive side...as I reset the settings (started with a local FM repeater) the radio appears to be working. Haven't tested on HF yet. Looks like the radio went through a factory reset. Not sure why.

I'm new as a HAM and this radio is new to me as well.

I have the CAT cable but I don't have any software for imaging the settings on the radio. I see a few software packages on Google for this purpose but would appreciate any recommendations.

Thanks.

Did this happen right after you moved the antenna a llittle further away from the pole and the house, from the shack? It is possible this change positioned the radio (and or operator) in a stronger RF or magnetic field or caused RF to circulate somehow in the shack where it was not present or not present at the current strength, before the antenna was repositioned.

Subject: [FT897] Re: What the @#$% just happened?

Jay,

Thanks for the heads-up. I gave a quick skim of the reviews (I had read them before buying it) but did not see anything at first glance that looked like what I have happening.

However...

One of my first thoughts when the radio reset was that I needed to take a close look at the tuner.

The tuner has functioned flawlessly thus far. Of course, that isn't proof positive that it didn't flake out all of a sudden.

I'll keep that in mind.

For the time being, I am going to try going back to 20 meters and reducing power and see what that does for me. I just don't know what conditions can trigger a reset (short of the manual input sequence).

My ground outside appears to be intact on my grounding rod, so I am puzzled.

However, someone mentioned maybe RF in the shack. Well, the antenna passes along the opposite side of the wall where the radio is. However, after 6 months of operations with no problems, I re-oriented the antenna in such a way as to actually put MORE distance between the pole and the house. Now this happens. Really weird.

Well, I guess I get to investigate this. Too bad I was looking forward to the first time I'd have time actually USING the thing with lots of time.

Alas, hopefully I'll come out of this a bit smarter about how the equipment and antenna all works.

Thanks again for your input.

Sounds like RF feedback. You might need a current balum in line between the tuner and the antenna.

Subject: [FT897] What the @#$% just happened?

Okay, so I FINALLY get some vacation...get a few minutes to play with the radio. This is an FT-897D with the FT-30 power supply, an LDG-897 tuner hooked to a G5RV-jr. Have had NO problems with this setup at all for 6 months.

Earlier today I was on a 2-meter repeater, and this evening jumped on to try an HF contact (haven't had on in a while). Was unsuccessful a few times, switched over to 20 meters, tuned up, found a free frequency and tried a CQ call.

The radio shut-off (powered down completely), then in a second or two powered back up with a pink screen and what appears to be all settings lost. All memories are gone, even the simplest settings seem to be erased.

On the positive side, I can hear stations on HF so the receiver is working.

What the heck just happened? something trigger a complete reset?

I searched the forum but did not find anything on this. Oh boy is this going to be a pain to try to get all those settings back!

Peter,

For software I HIGHLY recommend Bob's Basic MMO.
http://www.g4hfq.co.uk

You can download it, set-up all the repeaters, and be in good shape if the reset happens again as you can reload everything with a few clicks.

Bob is very consumer fiendly.
I got a beautiful used 897 but the radio and computer were not able to communicate.
I knew the cable was good because it worked with my other 897.
Bob immediately replied to my e-mail and was able to diagnose the problem.

Diagnosis - No power at the CAT port because of a blown internal fuse
A USB cable would work, while the serial would not, because
it gets power from the computer.

I found the Mod instructions. I didn't do the F + V/M reset. (The radio has been unused since the mod, finally getting back to this particular 'brand-in-the-fire'). It now seems to be working. Starting to really appreciate what a nice little rig this is for the price. Just uploaded an RT Systems file for the radio. I'm a happy camper. Thanks for your responce!

From: David F. Reed
Topic: 31112 Message: 31112

I am selling my FT-897D, with LDG AT-897Plus tuner, internal batteries and charger, and LDG external S-Meter.
Has MARS mod done. FP-30 optional internal power supply (fits in battery space; cannot do both at once) as well.

I am hoping to get $1000 for all (list totals over $1600), Shipping included.

If interested, please contact me directly at w5sv.dave@...

I had the same problem with a third party charger for my MacBook. Charger works great but it spews RF. I purchased a real Apple charger and no more issues. Once again proving you get what you pay for.

I was able to quiet the other charger by using several ferite beads.

Peter -
I did not see anyone mention making a simple choke balun out of coax. This is a very effective way to stop RF current from going backward in your antenna cable to the radio. If you are having RF current issues, this can be the solution. And make sure you have a true and proper station ground.

Rather than re-invent the wheel, see http://www.hamuniverse.com/balun.html
for various examples of making this type of balun. You might have most of the materials around your place but in any event, making these are cheap and very effective.

31115. Display color menu #041 question

Yahoo group: FT897 (2010)
Date: 2010-09-01 20:47:56 UTC
From: mmeenan43
Topic: 31115 Message: 31115

When I enter Menu #041, the rig allows me to change the display color, but nothing else. In other words, I can choose FIX 1-32, but am not offered BAND, ARTS or any other choices supposedly available under this menu item -- can't get out of FIX. Am I missing something?

Mike, ND6MM

31116. Re: Tuners? FT-meter?

From: mmeenan43
Topic: 31077 Message: 31116

I have a YT-100 which I just got a couple of weeks ago.This one fits nicely on top of the 897 -- I didn't like the shape of the bolt-on version. Also, the YT-100 lowers the output power of the 897 as it tunes and then restores it to full power when done. I think with the AT-100, you might have lower the power manually, which is a bit of a pain with the menu, until the AT-100 "memorizes" your frequencies. You will, of course, need to get a meter to use with the 897 if you get the YT-100. The FT meter is a good choice unless you want cross-needle display.

Mike, ND6MM.

Need some advice I bought a new FC-89d with add on auto-tuner and a MFJ hi-q loop antenna (MFJ-1786) and 2 hamsticks 75 m. and 40 m.. I think I may have over bought but not certain. Do I need the auto-tuner with the hi-q loop antenna? And what about the hamsticks? I was going to put up a 6 ft. SS whip but being up on the 8`th loor it might be too flimsy.

Appreciate all the assistance. New to balcony antennas.

From: OHM
Topic: 31120 Message: 31120

Hi everyone heres a question.

Has anyone wired up a Shure 444 mike to a Yaesu FT897D.
If so how well did it work ?
I would be interested in comments as i'm thinking about buying a Shure mike.

31121. Re: New Ham

Yahoo group: FT897 (2010)
Date: 2010-09-02 18:39:53 UTC
From: Jim
Topic: 31061 Message: 31121

Welcome to the hobby, William! I'm a relatively new ham myself, having gotten my tech license in October 2008. I hope you're like me and looking forward to many years of radio fun!

Just wanted to add my two cents' worth to the well-written comments you've already received. I purchased the FT-897 when I earned my General license last year because of it's all-mode, DC-to-daylight capability. It's a relatively low-cost, portable radio with which I can do almost anything I want. Though I haven't finished it yet, I'm building a 2 m, five-element quad antenna to use on SSB. That was one of my reasons for buying the 897. I've been using a G5RV with good results for the past year. I think you'll be pleased with it.

Good luck, and 73!
Jim

Have you tried depressing the MEM/VFO knob (after entering Menu 41)
to toggle between selecting the color and when it is to be displayed?

Thanks Gene.

I have a Radio Works T-4G Line Isolator, which I thought was in part performing the same job...preventing RF from backtracking up my feed line. I'll have to educate myself a bit more to see if this covers that base or not.

From: pascalpete
Topic: 31087 Message: 31126

Stanton,

Yes, this is every much what happened. However, I had one afternoon of use without any problems. I *think* this is because I was most likely not on 20 meters (nearest I can remember. I made no contacts that day, though I did try CQ calls more than once. Might have been on 40 meters.

My current theory is that RF is the problem and most likely caused by the antenna re-alignment. Said realignment brought the antenna out away from the house but now in direct line-of-site to my rather long grounding wire that exits my second story room and goes down to the ground. That has always been a concern of mine and I think I might be getting RF into the shack along this line. I haven't had time to run any tests yet since this problem came up, but I am hoping to run some tomorrow.

I do have an MFJ "artificial ground" box which is not yet hooked up. Perhaps when I hook it up I will be able to de-tune the ground wire for 20 meters...assuming that is the problem (which is my odds-on favorite at the moment).

But first, I am getting that software mentioned by others to allow me to store my radio settings before I test. Actually, the low power testing will be the first thing I try...along with testing on other bands.

I appreciate everyone's feedback. It has been very educational for me...especially since I am a ham of less than 12 months.

Subject: [FT897] 897D Stored radio now no audio

Ok, I have been on the road alot and had my 897D put up. I got it out the other day to work a little CW and decided to do a MARS/CAP mod. End result is no audio out of the speaker or the external speaker plug. Radio shows that it is transmitting as it should and works perfectly just no sound. Any ideas?

I just got a brand new macbook pro 13 inch. the charger is horrible with rf noise,
all over the entire hf band. It's the OEM one that came with the laptop. Shame on
apple. they are normally good with that stuff. I can't charge the mac and use the 897
at the same time. Unplug the charger, no noise. Going to try and add clamp on toroids.

Hi,

Is ther emoting like a dummies guide to the ft897? Ikeep trying to find menu e, it says press f and then select menu e but I can get there, it just circles around the 90 options in setup. I wanted to be sure pl was on for two metros.

Thanks,
Robert

HI Robert,
As the others have said , ALL you need to do is to just
PRESS the F button for ONE SECOND so that you can alter what the A, B & C
buttons do. After you press the F button you then turn the Selector knob to
go through a b c d e f etc etc

Also it quite simple to add repeater fregs into a memory, just read the
section in the manual
1st before you save a repeater freq to memory you have to have the minus
sign (2m) or + for 70cms and the ctcss in the display then you save to a
memory empty number 001 etc ,
just read the manual , what i do is to write what steps i need to take do
what i need to do. saves me re reading the section in manual again

31140. Inrad 2000Hz 455Khz SSB Filter reviews wanted

Yahoo group: FT897 (2010)
Date: 2010-09-11 10:44:30 UTC
From: klokkenman
Topic: 31140 Message: 31140

I am interested in reviews of users who are using an optional SSB filter in combination whit the FT-897. Yaesu only provides an 2,3Khz 455KHz filter, but according to the reviewers I read, this one is a bit disappointing. The US company Inrad offers an 2,0Khz 455KHz filter, but in Holland this one can only be obtained from an internet store in Germany, England, or directly in the US..
Before ordering one I'm interested in some experiences of other FT-897 users.
Maybe some Dutch HAM operators are also interested and willing to order one, so maybe we can split US ordering and customs costs by making one combined order.

It seems like you have the number E in Your hidden section.
I think it's the first option in the menu section to turn the hidden menu on.
If you don't want it there, just select it in the hidden menu, and then press the A button when it mentions Skip. The dot (upper right corner) changes into a -, and you can access it again from the main menu.
This way you can put options in a second menu, so your first menu stays easy to access.

From: Jirka MWW
Topic: 31140 Message: 31142

I have an Inrad 2.3 kHz filter in my FT897D and it is much much better than original ceramic filter. I assume, that 2.0 kHz will be quite too narrow , especially for VHF contest operation
and when tuning in 100 Hz steps.
I have ordered directly from Inrad and I did not pay any custom duty. There is some limit for import to EU and this filter (single one) is far below this limit, as far as I remember.

Best regards Jiri OK1MWW

Topic: 31146 Message: 31146

Hi All

Thanks to all those who helped me on the static crashes on AM, I have another one since I had the rig repaired by yaesu UK good turn around one week I have started to use the vhf and uhf side of the rig the sound off squelch is like an motor bikeish when ant is not connected it is the same NO readings on the s meter just the sound? receives ok but it is to me not right as I have 817 and vx8e they sound good af CLEAN.
so is it another filter that yaesu missed!!

Thanks in advance.

31147. SSB ALC adjustment issue...

Yahoo group: FT897 (2010)
Date: 2010-09-11 21:22:12 UTC
From: marshallstax
Topic: 31147 Message: 31147

Maybe this has come up, but here's my issue:

The ALC meter never registers at all in SSB mode, regardless of mic gain setting, with the power out set to 100.

As you lower the power output the ALC begins to show... at "20" I could make (accurate?) adjustments to the SSB Mic Gain and see the ALC meter changing in response to up or down level adjustments on the SSB Mic Gain (menu 81) control.

As I turn the Power Out (Menu 75) back up to 100 the ALC meter fades down to nothing... no matter how high you set the SSB Mic Gain (even up to "100") the ALC Meter never registers at all.

There seems to be no audio change (as in distortion or overdriven pre-amp sound) as the Power Out is raised... the only change in anything is that the ALC Meter stops showing anything as you raise the output power.

On PSK31, this is not an issue... The 897 itself is set to 100 watts output, and the actual output power is changed by the TX knob on the SignaLink USB box I use - I keep the output below any ALC meter reading... the ALC meter will register if I raise the TX knob too high - approaching about 80 watts out (on the Daiwa meter I have).

So, why does the ALC meter on the 897 not respond (in SSB mode) at full power out setting?

31148. computer control program options

Hello, other than HRD, what are your favorite computer control options for this radio? Anyone use Supercontrol software? Its looks real nice bit it costs about $100.

Thanks

31149. Re: [FT897] computer control program options

Yahoo group: FT897 (2010)
Date: 2010-09-11 22:01:27 UTC
From: Dave
Topic: 31148 Message: 31149

When using Linux, Hamlib and GMFSK / FLDIGI do the job.

For Windows, I like the idea of HRD and have tried quite a few versions over the years, but its such a monster and has too much decoration that serves a purpose I don't need (and cant switch off). Sadly it is mainly beyond sprightly use on my computers,

So I tend to stick with applications that allow me to do otherstuff at the same time (Like Mixw and MMSSTV) but HRD is great for impressing people or demonstrating large groups at once.

I wrote my own stuff. The base library (perl) that I use is at
http://www.0xdecafbad.com/FT8xxCAT.html and some of the memory locations
are mapped at http://www.0xdecafbad.com/FT897memory.html (I have been
lazy and the memory map is not complete, if anyone wants to help with
that I will add to it :)

In this way I can control the radio exactly how I want which includes
some non-standard interfaces, but then I am weird that way.

My current project is to control the radio with an asus 520gl wifi
access point using usb for both sound and the serial interface
delivering the content streaming over the web. I have not yet finished
that interface though so it is not yet available for use.

31151. Re: SSB ALC adjustment issue...

Yahoo group: FT897 (2010)
Date: 2010-09-11 23:16:39 UTC
From: Steve Yates
Topic: 31147 Message: 31151

marshallstax,

It is normal on the FT-897D for the ALC to be more active when the power is reduced. However, you should still be able to get an ALC reading when using high power. It seems that your audio drive simply isn't enough for some reason.

This is a long shot but make sure that you don't have the speech processor on (MFc) and it turned way down (MENU MODE No-074). The SSB MIC GAIN and PROC LEVEL do counteract each other.

73,
Steve - AA5TB

I do not know much about HRD, so I do not know if it is doing anything
that I do not have documented on my site. I am the author of the
material at 0xdecafbad.com so I can speak on that.

There are 2 groups of commands, documented and undocumented. The
documented is the larger of the two groups, as for the undocumented it
includes:

readEeprom
writeEeprom
getRadioConfig
getTxMetering
factoryResetandEraseAlignment

If you can give an example of something HRD does that is not documented
I can try to see if there is a way to accomplish that based on what I
know. There are actually a lot of documented commands and the CAT
commands for the 817, 857 and 897 appear to be the same, although the
memory layout is different for the 817 vs 857/897.

The read/write Eeprom commands can actually give you some benefits that
you do not otherwise get which can open a bunch of doors for you. It is
also very easy to specify the wrong address and force a reset of the
radio (he bootstrap code in the radio should always be able to recover
with a full reset, but you will lose your alignment settings). The
program should be cautious when writing.

DXLab supports the FT-897, and is free. DXLab is a suite of applications that automatically interoperate; you can start with one, and if desired add more. DXLab applications also interoperate with a wide range of other applications, including MixW and MMSSTV.

Subject: Re: [FT897] computer control program options

When using Linux, Hamlib and GMFSK / FLDIGI do the job.

For Windows, I like the idea of HRD and have tried quite a few versions over the years, but its such a monster and has too much decoration that serves a purpose I don't need (and cant switch off). Sadly it is mainly beyond sprightly use on my computers,

So I tend to stick with applications that allow me to do otherstuff at the same time (Like Mixw and MMSSTV) but HRD is great for impressing people or demonstrating large groups at once.

Thanks for the quick Response... I checked the processor - it was off -- I also did a quick check: calling out while dialing both processor level (w/proc off) and ssb mic gain up & down while watching the alc meter... no response, in any combination of settings, at 100w out.

Weird.

As I said earlier, the full up (100) setting on SSB Mic Gain is noticably louder, and the power out meter on the radio (and the outboard meter) swing somewhat higher with a "100" setting, but it never sounds distorted or overdriven. The mic is noticably more sensitive to things like handling noise at full level, as you'd expect... its a Yaesu MD-100 mic, BTW.

I was monitoring, using headphones, on another 897 with its RF gain dialed down...

UPDATE...

I was doing all this testing on 10 meters... now, on 17 meters, the ALC meter on the 897 seems to be responding normally.

I'm using a Windom DX 40-10 RadioWavez antenna tuned with an LDG AT-897 Plus tuner.

Why would the band I'm on affect the ALC sensitivity? (Or the hotness of the mic?)

I covered this material in a post before placing the eeprom tools on my page anticipating this argument specifically. It is very common for people to talk about.

Unfortunately most people do not look at the math side of the equation to this argument, they also do not understand what the radio does during normal usage, or if they do they are intentionally spreading FUD (fear uncertainty doubt). Either way I will address this issue.

http://www.0xdecafbad.com/2009/08/the-dangers-of-eeproms/

During normal operation of the radio, anytime you change the frequency, vfo/mem state, mode, band, etc the radio will write to the eeprom. This is so that you can go through a power cycle and still have your last used settings. The memory location can be dumped by reading the eeprom to validate that this is true and that it is not just some volatile ram with a battery backup, it is really the eeprom that holds this info.

This means that if you are scanning a band you are causing potentially hundreds of writes to your eeprom from that one session. Writes to the same address space, as opposed to various ones spreading the wear across the chip uniformly.

Looking at the math specifically:

If the chip supports 100,000 writes you can write just over 13 times a day, every single day for 20 years.

If the chip has 1M writes guaranteed before failure that would be just over 136 writes a day, every single day for 20 years.

I do not know what the eeprom has as a guarantee but since changing the mode, frequency, whether you are in VFO/MEM mode, or virtually anything else on the radio causes a write to the eeprom (verified by reading the prom) I am going to guess that it is a somewhat large number. Some are 10M writes which would be more than enough for a 20 year life of the eeprom, in fact with normal usage that would probably be closer to 50-60 year life of the eeprom.

From what I am hearing and reading

its a rolling update..

Resistance is Futile you may be right ..

or we can leave the mother ship and start a new group on Google or qth.. maybe they will not be Borg ed

My FT 897D is several years old now and working great.. still love the looks and the opeation of the radio on CW and SSB

in the fact it covers HF and VHF UHF is great...

If someone were developing their own CAT application and inadvertently created a loop that continuously issues EEPROM write operations, how long would it take to consume the EEPROM's 1M lifetime write budget? Assume the CAT port is running at 38K baud.

the baud rate is less important than the rate at which the command
returns. It is slower than the serial port rate can handle.

So lets go to the errant coder example. Assuming that they are writing
to the same location in memory over and over (the more memory they write
to the longer it takes for the command to complete since you have to
write 2 bytes at a time until you are done).

1,000,000 / 365 / 24 / 60 = 1.90

So an errant coder could write twice a minute for almost a year before
wearing it out. If they were doing it 20 times a second (any faster and
I would question if the radio will keep up) then it would take just over
a month.

I do not think that either of these situations warrants the original
"should not be indiscriminate" comment nor the general paranoia that
people exhibit when it comes to writing to eeproms.

The flip side is if a user turned the tuning dial how long could they do
that before wearing out the eeprom? As I previously stated changing the
mode, frequency, band, etc causes a write to the very same eeprom in a
fixed location so its wear is cumulative over time. While these are
likely to happen less rapidly than an errant coder it does still happen
each and every time the radio settings are changed. Radio settings are
changed far more frequently than errant coders who write a tight loop
that writes to a tiny bit of memory over and over and then it gets left
for extended durations. :)

the baud rate is less important than the rate at which the command
returns. It is slower than the serial port rate can handle.

So lets go to the errant coder example. Assuming that they are writing
to the same location in memory over and over (the more memory they write
to the longer it takes for the command to complete since you have to
write 2 bytes at a time until you are done).

1,000,000 / 365 / 24 / 60 = 1.90

So an errant coder could write twice a minute for almost a year before
wearing it out. If they were doing it 20 times a second (any faster and
I would question if the radio will keep up) then it would take just over
a month.

>>>20 times per second is 50ms per operation - a lifetime for a microprocessor. What leads you to conclude that the radio's microprocessor is limited to this rate? In the absence of measurements or the microprocessor's source code, ~5 ms would be a more conservative estimate, which means the EEPROM's 1M operation write budget would be exhausted in ~3 days.

>>>When building CAT software for an FT-8x7, one should definitely be careful with EEPROM writes.

I never once said that the microprocessor was limited to that rate, I
said the eeprom was, and when you do a write via CAT you have to wait
for the command to finish before it lets you do another command.

Regardless I dont want to argue with you over this. I gave you the
information I had, what I have tested and personally done. I even tried
to give you the information you asked for, and you want to somehow prove
me wrong with obviously incorrect assertions. I guess so that you can
then, by proxy, say that I am wrong over my comment that it is not
terribly unsafe for someone to write to their eeprom. The reality is
that it is more likely that someone will write to the wrong area in
memory and require a full reset (losing calibration data) as opposed to
wearing the eeprom out. I say that as a developer of software for the
897 specifically.

I am finished with this thread unless there are real questions or real
fact based comments that do not appear to be wild guesses to spread FUD
and bias.

31166. eprom/flash memory write mitigation [was: computer control program options]

Yahoo group: FT897 (2010)
Date: 2010-09-13 02:29:42 UTC
From: Dean Gibson AE7Q
Topic: 31148 Message: 31166

On 2010-09-12 16:55, Bret McDanel wrote:
> ... real fact based comments ...
>

First of all, my credentials:

1. 45 years software development (now retired),
2. of which the last 30 were embedded software development,
3. of which two years were working on a flash memory system (Datalight, Inc was the company) for inclusion in cell phones and other embedded devices where memory integrity is important across a wide variety of consumer usage,
4. of which 1/2 was improving the flash memory write mitigation; specifically, "wear leveling".

5. Oh, and in my spare time a few years ago I completely reverse engineered the eprom/flash memory (whichever it is) layout for the FT-897D and wrote a memory management program for it. The reason I have not made it public, is off-topic for this thread.

OK, what is "memory write mitigation"? It is the reduction of physical writes to a device which suffers from "wear" due to writing. The following techniques can be used:

1. Delayed writes, so that multiple "writes" to a memory location in quick succession result in just a single (delayed) physical write.

2. Caching in RAM, with detection of a power-off event (scheduled or unscheduled) causing writing of any unwritten data. Just today I discovered a bug in Icom's ID-880H radio, where a certain operation caused the flash to be updated but not the RAM (the reverse of the normal bug), so that when one examined a setting after the operation and then power-cycled the radio, the setting changed (changing the setting "normally" kept the two in sync across a power cycle).

3. "Wear leveling", which use an additional layer of memory mapping (kinda like a virtual memory system) to cause successive writes to the same "location" to be mapped to different flash memory pages, so that repeated writes to one apparent "location" are spread throughout the device. These techniques are sophisticated, clever, and patented, and whole businesses are built on them (eg, Datalight, which provides flash memory system software to Toshiba, Motorola, SanDisk, Texas Instruments, and others I can't remember).

This last concept is important to grasp. I have had arguments with digital photographers about how successive "reformatting" of a CF card writes the formatting information to different locations each time. It doesn't matter whether it's done in the camera or a CF card read attached to a PC; the software that controls the "wear leveling" is in the CF card's controller.

So, the bottom line is that, as Bret states, it's pretty difficult to "wear out" a modern flash memory device, although it's not unheard of.

31167. FT-450 vs FT-897 Current draw and field use opinions

Yahoo group: FT897 (2010)
Date: 2010-09-13 03:32:42 UTC
From: ke7adu
Topic: 31167 Message: 31167

Greetings,

I own both an FT-450 and an FT-897D. I purchased the FT-450 this spring and was very impressed with the improved receive over the 897, so much so that I have been considering selling my FT-897 and purchasing a second FT-450 for field and ARES work.

This weekend I did some current measurements on both radios that may have changed my mind. I am posting those measurements here for your review. My measurements were made with a simple ($60) VOM so I can't say they are precise but the relative numbers should be useful for comparison.

FT-450

FT-897D

RX Current

0.78

0.35

TX Current 100 Watts

14.50

13.30

TX Current 20 Watts

7.70

6.20

TX Current 5 Watts

5.25

3.75

TX SSB no drive

3.80

1.62

Estimated 24 hour Ah Usage 25% duty

100W

101.04

86.10

20W

60.24

43.50

5 W

45.54

28.80

I am interested in hearing from those who:

1. 1. Have added the either a 2000 Hz or 2300 Hz mechanical filter to the radio. Was the receive improvement enough to justify the cost?

2. 2. Have used the FT-450 and FT-897 side by side in the field. What are your thoughts on which radio is best for field use?

KE7ADU,

I own both an FT897D and an FT450 and I consider them different radios, not a newer version of a design.

I have never used them side by side in the field nor fitted any mechanical filters.

I have noticed the higher current draw on the FT450 but I had already read, before I purchased, the FT450 has extra current drawn.

I find them a good complimentary pair. There are a lot of minor differences. I have batteries fitted to my FT897 and with the 2m/70cm capability that makes me not even consider the sale of the FT897.

It really depends on your requirements.

And that was my point. It is far more common to corrupt the memory by writing to the wrong space that it is to wear it out. There is a knee jerk reaction to one of two things anytime someone mentions writing to the eeprom. Either an errant signal will brick the device or you will wear out the eeprom. I addressed both of these in the blog post on eeproms (previously mentioned). I think most of them are FUD (fear uncertainty doubt) arguments to try to scare people into never ever doing anything eeprom related with their radio.

Btw if you want to contribute to my reversing of the eeprom effort since you say you have finished I have most of it on my webpage. I just got bored and never finished some of the areas. I would gladly take contributions :)

Sean,

I've had good results with the stock mike on all modes except AM. For AM the audio is much cleaner with a microphone that has a higher frequency response. However, as is the case with almost all rice box rigs that have low level modulation it can often sound like the carrier it too weak, sort of like listening to SSB with an AM rig. To me it seems like it is the base response that causes this and microphones like the old Astatic D-104 microphones with their associated high frequency response sound better on rice box AM.

Date: 2010-09-13 18:48:13 UTC
From: harry latterman
Topic: 31167 Message: 31175

At this time I do not have my FT-450 (Traded up for a IC-7200), but when I did have it, I did a comparison with my FT-897D which does have a 500 hz CW filter as well as a 2.3khz filter. Based on my tin ear at home and camping in the woods they are different beasts. The DSP features of the 450 are a lot better then that of the older 897D design. The reciever is hotter and the 450 does have a lot going for it. However the 897D with filters activated did a great job also. The 897 looks and feels like an outdoor, knock around radio. Plus the added feature of 2 m and 440 makes it even more fun in the field. To me it's a keeper. We won't compare the 7200 since it kicks the butt of both radio, but I will say more then half the time the 897 is the one I take out for a field trip. Power wise all IF DSP radios today suck power like crazy. This is true for the FT-450, IC-7000 and IC-7200. One day they will figure out how to do the magic IF DSP and not suck power.
But for now if you want the neat features of this type of DSP you will pay the price with a battery dying sooner. Can not be helped. One added note about my 897D is the fact I have the optional internal PS and a LDG AT-897. This makes a much, much better configuration then the junk ATU that comes with the 450/AT. 3:1 in the field just does not cut it. 10:1 in the field does. So that is my 2 cents worth...

Nothing wrong with the stock mike. Vertex uses it on their commercial HF radios.
I do not thing the mike has anything to do with your AM problem.
That may be caused by high SWR cutting back the power.

Ditto. I am on 160m more than half the time I'm on the air and I've never had any problem with my FT-897D. The only RF problems I've encountered with the rig to date involved the attempted use of a computer headset w/boom mike on 2m. That proved unworkable, though likely due to the cord not being shielded well enough. FWIW, the same setup works just great on 160m.

I believe the stock mic is designed to provide good communications-quality audio, and it largely succeeds. I've never had an MH-36E8J (the one with a DTMF pad), so can't comment on that one. The MH-59A8J (remote hand mike) is a slick everything-built-in-but-the-kitchen-sink mic, but sounds the worse -- I'm told lots of breath noise.

What level of mic gain are you running? The default is 50, but based on what others have told me, that much audio is on the verge of being biting. I'm currently running a mic gain of 15 on SSB, and am told it sounds much more natural.

This thread is personally interesting, although probably veering off topic for this forum. I got interested in flash memory after ordering a SheevaPlug computer to play with:

http://www.globalscaletechnologies.com/p-22-sheevaplug-dev-kit-us.aspx

The NAND memory on this device holds an active Unix file system, in addition to the boot software. Indeed, I had some initial concerns about inadvertently wearing out the memory by simply running an active OS. The file system -- one specifically designed for flash memory -- employs several forms of wear leveling, and is probably good enough to provide years of reliable service. OCZ is currently making Flash Sata II drives (no moving parts) warrantied for 3 years, so I suspect NAND devices and today's robust wear leveling technolgies are coming of age.

That said, I would be surprised if the FT-897 writes its flash every time the frequency is changed. (I'll defer to Bret or Dean if they know, though.) I would suspect an update only occurs on certain operations, such as changing bands, or powering down the rig -- the RAM "caching" Dean talks about.

Also, does anyone know if the 897 employs virtualized wear leveling? I would not be surprised if it does. This sort of thing may even be hidden in the hardware within the flash memory module itself. I think all current SDcards and thumb drives have it. OTOH, the 897 design is rather old (circa 2002?) so maybe it embeds the leveling in the 897 software.

It seems both Bret and Dean have both delved into the memory of the 897 in some detail. I'd certainly be interested in hearing more about what they've discovered.

The MH-59A8J is a hotter mic and more sensitive than the dynamic element in the stock mike. The mike gain needs to be readjusted for each mode.

Maybe try and decrease the mic gain on the dtmf mic to get rid of the "breath noise". This might even work on the Heil. There are other mic adjustments in the FT-897 main menu that might help tweek the mic.

How I came to this conclusion. I removed the internal batteries. I then connected a 12v feed to the rear of the radio (not using the power supply tray but a standalone 12v power supply). I turn the radio on, spin the knob and cut the power. When I reapply power the frequency I was on is restored.

The only way that it can do this is if it is writing the frequency or if there is an internal capacitor/battery capable of flushing ram to nvram (eeprom).

Given this I believe that it is written "live" and they use the other method Dean talked about (it is slow responding to a 'write' request). While the storage media itself may do internal wear leveling I doubt that for a variety of reasons.

http://www.0xdecafbad.com/2009/08/ft-897-memory-map/ I do not seem to have it documented, Dean should know where it is though :) There is a memory location for the current radio settings. Once you change the freq or other parameters it gets saved so if you power cycle the radio it will be able to go back where you left it.

> Also, does anyone know if the 897 employs virtualized wear leveling?

It could be, the easiest way is to locate the prom and pull the data sheet. That will also let you know how many writes are guaranteed (as much as anything is).

> I think
> all current SDcards and thumb drives have it. OTOH, the 897 design is

That would be in the eeprom that is in the cpu (assuming its using the design I seem to recall).

I guess some additional explanation should be given for readers who do not keep up on such things :)

Some embedded cpus have a small eeprom physically inside them. This is often used for the bootloader and will bring up external eeproms or other storage media. If the entire application is small enough it will be contained 100% in this eeprom.

In addition to the program that runs which controls the radio, reads button status, etc, there is the bandplan data, memory locations, etc.

It appears to me that the "read eeprom" command reads from managed memory (not quite an MMU but a somewhat similar concept). Take the 60m memories that exist only in certain configurations. The memory space should always be there if it is not mapped by something. Because you request data to be read as opposed to directly reading it this is entirely possible to do with a limited amount of memory being consumed.

The area that you appear to get access to when reading the eeprom is only the memories and what not and not program code or bandplan data (although the jumper setting data is available).

I do have an undocumented CAT command that does not appear to do anything. It is *POSSIBLE* that it enables other areas to be read. It seems to me that if Yaesu is going to upgrade your firmware they would not want to desolder and resolder a new chip if they do not have to.

What I have not done, and maybe Dean can comment.
I have not looked for which chip the cpu is to identify what eeprom it has internally.

I have not tried to see if there is an external eeprom or if its all on the in-cpu eeprom.

Chip numbers should yield data sheets fairly easily if they are standard chips (its so easy and fairly cheap to get a custom label on the chip, or make a custom chip that is really a composite of a couple others).

I have not finished my memory map, and will not for at least a month now (although after this I am more inspired than I had been :) I will have internet over the next month but will not be able to have access to my radio, so at best I can take submissions from people that more completely documents the memory locations :)

lets add the cpu to that list :)

http://pdf1.alldatasheet.com/datasheet-pdf/view/249719/RENESAS/HD64F2134AV.html

The chip on mine is H8S/2134A series. I cant imagine this would change
much since it would increase development and support costs long term.

128k rom, 4k ram

That is certainly enough to hold everything and not require an external
eeprom.

I do have an external eeprom, 128k 24lc1281.
http://www.alldatasheet.com/datasheet-pdf/pdf/194702/MICROCHIP/24LC128-I/SN.html

It might be interesting to do a dump of that eeprom and see what it
contains. It is tied directly to the cpu, but I really didnt look up
which pins are which. I appear to be getting old now and require a
magnifying lens and can no longer trace stuff with my bare eyes. I had
problems reading the chips which is a first for me :/

Specs seem to include:
More than 1 million erase/write cycles
Data retention > 200 years

Interestingly you write to this chip in virtually the same way you use
the write Eeprom command via the CAT interface. This may be a
coincidence though.

Anyway, this is all I have time for before my flight. It should give
people a bigger leap if they want to start digging into things.

If anyone has the ability to dump that eeprom I would love to look at
the dump, email me off list if you can provide one.

Well, the only information I have on CAT operation is from the FT-897
manual, pages 63 and 64. Since CAT seems to be standardized across
much of the Yaesu line, perhaps there is better documentation for it
elsewhere. But, for the specific example... Well, there is nothing
in the FT-897 manual specifying the opcodes for, or how to control,
the various analog functions -- RF Power, Mic Gain, VOX Delay, etc. --
yet HRD has sliders for all these functions that work well.

OTOH, HRD also seems to have some glaring errors: If you, say, adjust
the IF Shift from the radio, and then change another parameter from HRD,
the IF Shift setting will be lost. Also, there are some squirrelly
things that happen when trying to control the DSP functions from HRD.

I have it on my to-do list to take a closer look at your excellent site
at some point. However, at the moment, I've got too many other things
going on.

CAT is standardized to the lowest common denominator. There is no way to know what version is supported so it does not have extended command sets that I am aware of. Everything uses the same version, which does not have the features for newer radios. They could just rely on the "invalid command" return value and add in new features but it appears Yaesu does not particularly like the CAT protocol for some reason and they never made it as robust as it could be. Probably the hardware guys and software guys bickering about what should be a hardware control and what should be a software control so it never got enhanced :)

http://www.0xdecafbad.com/FT8xxCAT.html for my perl lib which does not have any of this although it might if it is confirmed that its a memory write that changes it. Confirmation would be simply writing to 1 and only 1 parameter and seeing if it changes, then going to the next and seeing if they can be stacked (ie change multiple things and see if any revert).

http://www.0xdecafbad.com/2009/08/ft-897-memory-map/ for the memory addresses referenced

I do not have an opcode for setting the power, it is however stored in a known memory location (odds are this is different for the 817, but it should be these locations for the 857 & 897 - all testing was done on the 897 and afaik there are not different 'generation' maps but there might be ...)
00:9b RF Power Set HF value in watts
00:aa RF Power Set 6m value in watts
00:ab RF Power Set 2m value in watts
00:ac RF Power Set 70cm value in watts

I am just going to guess here, although I personally have not tried it, that if you write a new value there then Tx, it will Tx at the new power setting.

When you write to the eeprom you go through software on the cpu. This can take care of setting everything required through a variety of means internally so that your settings are live as soon as you specify them. The reality is that it does not matter how, either it will use the new values or it wont. If it does I do not think it matters how (for anything related to this topic).

On a similar note, when you press the PTT button (or anything else save 1 or 2 knobs) it is sending an event to the cpu, which in turn is processed by the firmware in the radio. At this point it can read the values required to set the radio into the mode it should be in for transmission. So there are a variety of ways that scribbling to memory can achieve this and I am about 75% confident this is the method that is used.

00:77 Vox delay in hundreds of ms
same guess, that the memory locations are read at Tx time. Again, its just a guess, but it would not take much to try it.

00:7a SSB Mic gain
00:7b AM Mic gain The first bit is not counted, on mine its always 1
00:7c FM Mic gain
00:7d Dig mic gain
00:7e PKT mic gain (1200)
00:7f PKT mic gain (9600)
And again, still guessing.

I made the map by dumping the data in question, change 1 thing, dump again and see what changed - and how. Lather rinse repeat. Its time consuming and that is why I have not yet finished, oh and its also really boring :)

> OTOH, HRD also seems to have some glaring errors: If you, say, adjust
> the IF Shift from the radio, and then change another parameter from
> HRD,
> the IF Shift setting will be lost. Also, there are some squirrelly
> things that happen when trying to control the DSP functions from HRD.
>

That may be more of a limitation on how you can change it, if they are as I suspect writing to known areas of memory (eeprom) then it may be that the radio is resetting some values because there is no proper way to do it.

I can think of a bug in the software that would cause this, although I have no idea if this is the culprit. They could be using a queuing system, such that you make a bunch of changes then it will try to commit them all at once. If the queue is buggy then changes are lost. Then again it could just be the radio itself is losing them. Because I dont know (and have never used HRD) I cant really blame anyone for the bug you described, it can just as easily be one or the other.

Sniffing the serial port to see what they actually send would be able to tell when commits are done and how. There are several free tools that let you monitor activity over a serial line, you only have to google for them (virtual serial port monitor is a likely good starting search term).

Chuck,

I'm not sure I understand your original comments.

Is the noise after transmitting (and staying about an hour) audible on all bands (albeit at different volume levels for different bands)? My interpretation is that it is. Does this include 2m/70cm?

When you have the noise after transmitting have you tried disconnecting the antenna? Does the noise then disappear or is it still audible? If the noise disappears I would think you have someting wrong with your radio. If it doesn't are you running on an external power supply? Have you tried batteries?

I found the ZLP Digimaster Pro+ interface to be very good. The only downside that I found was that I was expecting there to be just the one lead to the PC (a USB one) but there turned out to be 3. One USB and two audio cables (PC Line In and Line Out). However, functionally I can't fault the operation of the Digimaster and IMHO it offers exceptional value for the money.

31192. Anyone thought of using the Sony US18650GR Lithium ion Batteries W/Tabs?

Yahoo group: FT897 (2010)
Date: 2010-09-13 05:21:21 UTC
From: mchenryproj
Topic: 31192 Message: 31192

I do some maintenance at a broadcasting school these days and one of the instructors handed me a broken video camera battery pack a while ago. It is made up of multiple 3.7 volt Li-ion batteries in the 4/5C size model US18650GR. They seem compact enough and are 2400mAh each. Seems to me these would be a great choice and space saving too for FT-897D battery packs. 4 of these should be 14.8vdc at 2400 per pack of only 4 cells. That means only 8 cells would equal the 2 packs on the market now made with 22 total 1.2vdc cells. From one example retailer on the web, I can get 8 of these at 3.99 each. That's $31.92 for the batts. I have also found pairs used (pulls) on eBay for 4.99 per pair. According to some of the RC modeler boards they weigh in at 47 grams per cell. What would be fantastic is to find some sort of battery holder for these so you don't even have to solder them together.

Seems like a weight, space and cost savings to me. Will these fit? Is the 14.8 too high a voltage? Adding a fuse/thermister and a heavy diode in there should drop it to a safer voltage and provide short protection.

Not sure how these stack up to the standard packs being sold by Yaesu and the other folks. Still looking for a way to get less expensive batteries in the rig.

Hi everyone heres a question.

Has anyone wired up a Shure 444 mike to a Yaesu FT897D.
If so how well did it work ?
I would be interested in comments as i'm thinking about buying a Shure mike.

Bret:

I doubt it's dynamically storing the current frequency and settings all the time. More likely it's writing the current state of the radio to nvram on power-down. Should be plenty of time to do that between detecting a power down and a loss of power to the processor. There is a PO-DWN line to the processor that comes off of what looks like a circuit to detect loss of the 13V line.

Also in regards to "breath noise", talk across a microphone, not into it. This is particularly true when using hand mics.

And that may be, it seems sketchy that it can do this without some additional power source (battery/capacitor). Especially if the external eeprom is what is holding the setting data. That would be two chips that need power instead of just one, further exacerbating the problem.

All I know is that if you remove the batteries and the power the settings are saved. So if it is writing on shutdown it is doing so with some reserve power from somewhere, and that makes it a little more obvious to see where.

Bret:

According to the schematic in the service manual, the 5V regulator for the processor and associated circuitry is fed from 13V through a diode to a 1000uF capacitor at the input of the regulator. Clearly that's there to continue to power the processor for some period of time after power-down. Not knowing the load on that regulator it's not possible to calculate the time constant, but I suspect it's considerable.

Sean,

Two comments. First, the main thing you must research is current handling capability. Most LiIon batteries made for consumer electronics (like your camcorder) can not handle the large current draw that is needed for the 897. Make sure your batteries are rated for AT LEAST a 10C(24 amps) CONTINUOUS power draw. The RC batteries used for mid to high power planes can handle gobbs of power(20-100 amps). Normally they are also bigger than the batteries you mention. No free lunch!! If your camcorder batteries are being used by the RC boys for transmitter packs or low powered park flyers forget it! The newer Lipoly or LiFe batteries are smaller, lighter and have better current density than the OEM batteries but they are expensive and in the case of Lipoly's potentially dangerous, no free lunch!

Secondly, I am not sure if you got the OEM battery specs correct. Four 3.7 lion packs in series will give you 14.8 volts at 2400 mah capacity. two of these in parallel will give you 14.8 volts and 4800 mah. This equals only ONE! of the OEM battery packs as far as I know. So you would need 16 batteries to equal the two OEM packs the radio can hold. Also, remember that you are limited to 20 watts out by the OEM batteries. My guess is that your camcorder batteries would be much less than that. The 14.8 volts is technically within the 897's tolerance range. If you can dish out about 300 bucks you can get A123 LiFe batteries and the special charger you will need to charge them. They maybe will fit in the 897, and you would have to make your own packs and wire them. The advantage would be near full power operation (A123's are only 3.2 V per cell so 12.8V for a 4 cell pack, still in the 897 V tolerance range), longer life and safer operation. Personally I would just buy external packs and avoid the hassle of cramming batteries into the radio.

Hope this helps,

Randy

It is made up of multiple 3.7 volt Li-ion batteries in the 4/5C size model US18650GR. They seem compact enough and are 2400mAh each. Seems to me these would be a great choice and space saving too for FT-897D battery packs. 4 of these should be 14.8vdc at 2400 per pack of only 4 cells. That means only 8 cells would equal the 2 packs on the market now made with 22 total 1.2vdc cells. From one example retailer on the web, I can get 8 of these at 3.99 each. That's $31.92 for the batts. I have also found pairs used (pulls) on eBay for 4.99 per pair. According to some of the RC modeler boards they weigh in at 47 grams per cell. What would be fantastic is to find some sort of battery holder for these so you don't even have to solder them together.

Hey folks. Thanks for the info. Not sure where to get a fast track education on these new battery technologies. We don't use these things in the fields I have been in except for the older NiCd packs for 100W on camera lighting and camcorders in Broadcasting, and the manufacturers we stick to are a limited number of folks. Not going the NiCd route. Too expensive, low power and voltage, heavy and short life. I do have a few 12v batts from Bescor I have been using in my late evening listening sprees on the patio. If you want batteries with soft cases, take a look at them. They even have a new breed that's 14v. 12v is good but 13.8 would be great.

I have yet to learn about the C ratings for drain characteristics but have been trying to get bits and pieces from the R/C gangs online. Those guys know batteries it seems. I'm sure some of you guys do too.

I thought the Yaesu packs were only 2400mAh each. I'll look that up in a minute. I also found these packs on eBay aimed at the R/C crowd too. 14.8 @ 4800mAh pre-built into packs. http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=230526107674&ssPageName=STRK:MEWAX:VRI

I'll be looking into battery holders too. Thanks for the help.

The reason I went with the 897D was for the internal battery options but I was hoping others would have figured out less expensive on-board packs by now. Seems some enterprising Japanese or Korean companies might be missing out on a big seller here.

I would argue that its not "clear" but it is a good indicator. What
about the external eeprom that appears to contain the data in question?
Is that powered from the same capacitor?

I'd bet that it may also store rig settings to NV ram when changing bands... Notice how the rig comes back to it's previous basic setting and frequency when changing back and forth. You're right, continuous writes while dialing back and forth across a band would add up the write cycles for sure.

Hi,
While the on-off CAT command isn't listed in my manual, it's obvious that Yaesu has additional "hidden" CAT commands.

The reason I say that is because the MH-59A8J REMOTE MICROPHONE uses CAT input via the mic jack to the rig to change frequency and (FAST[Power]) and so on.

I don't know if Simon has incorporated these commands in HRD or not but it would be worth a shot to e-mail him directly and you may get the info you need.

simon@hb9drv.ch is his e-mail address.

Back in the day when I used to work for a local ISP back when 28.8 modems were the fastest thing around we had several POPs spread out in several of the local towns so folks could have local numbers to dial. We had devices on the equipment that plugged into the AC outlet then you plugged everything into this device which also had a phone line plugged into it as well. What you did is dial the number to the device, it would answer and you punched in your pin from your phone. Then it would give you the option to turn off the power to the equipment. You then waited a few seconds then selected another option to turn the power back on. I can't remember what these devices were call or a brand name but this would be one way to solve the problem. Just have it cut the power to your power supply or the 897s built in supply if you have that option.

Bret:

Yes, the EEPROM and processor are both fed 5V from the same regulator that has a diode feeding a 1000 uf capacitor on the regulator input. Considering that the regulator (M5278L05M) is rated at 100mA, we're probably talking at least 1/10 second and probably in reality .5 to 1 second before the 5V drops--nearly an eternity. Perhaps someone wants to measure that?

Besides, why else would they do it that way?

I dont know, but if the eeprom is also fed off that then it may write to volatile ram until power down is detected and then commit settings saving the eeprom. The cpu has volatile ram contained in it, 4kB iirc. So it can read the eeprom at start up and only write to it at shut down.

I am not 100% that the external eeprom contains the configuration data (what my library reads/writes via CAT) but I am about 80%. A dump would confirm what it holds, but my guess, and that is all it is, is that the external eeprom (128kbit) holds that data. The addressing format is the same way you do via CAT making it simpler on the cpu side of things, its the right size, etc.

A chip clip and an i2c bus would make it not terribly difficult to dump it. If the first 4 bytes at a55a a55a (hex values) then it is likely that it is the data without dumping the rest to see. It is my understanding that the cpu has enough code to write a base configuration should the eeprom ever be hosed (factory full reset which wipes alignment data too). I would be more interested if there are any differences in the data on the eeprom vs what you get via CAT, and more importantly why. But I am weird that way.

How this data is used is a combination of factors, such as your bandplan settings (whether or not 60m is pre-programmed), and such. The program inside the radio firmware contains the charset, which is full and complete (ie kanji does exist on US models) but you cannot access that in some bandplans (direct eeprom writes can write kanji, I have a character list on my page of what bit pattern corresponds to what value).

So it is still bifurcated in that the "secret sauce" is hidden in the cpu (near as I can tell anyway), and this is where yaesu would write for

a firmware upgrade. This is also mandated to be secret more or less because of regulatory agencies not wanting people to be able to Tx with 0 limits what-so-ever. AFAIK this radio cannot receive anything that is restricted by regulatory agencies, but there are so many in so many countries that may also be an issue.

I am just wondering if there is anything neat that can be added to the radio if this were opened just a little. The cpu supports an i2c bus (how it talks to the eeprom) so in theory you could hang add-ons off the radio that can manipulate it in some ways (although I yet to have a useful example of what you could be doing).

Thanks for clearing up the power off issue.

sean,

As a follow up to my previous message. I was mistaken on a couple of points. 1. The voltage per cell on A123 batteries is 3.3 V which is almost a perfect match for the 897 (13.2V for a 4s1p pack) 2. The cost for a set of packs that would equal the capacity of the OEM packs plus the charger would be closer to $400. Not cheap but not much more expensive than the OEM packs and charger. I looked around and found that the Buddie Pole site sells ready made A123 packs and has a lot of info on them. Check it out! http://www.buddipole.com/.

You also want might want to consider LiPoly batteries. They have the current density and power handling of the A123's but are cheaper and lighter. You must use them with caution as they can, how should I put it, light up your life! if charged improperly or pushed beyond their limits. Used with a drop of common sense they are a good alternative to the OEM batteries in both price and performance. Life expectancy is not as good as the A123's but for powering your 897 they should have at least as long a life as the OEM's given proper charging and balancing practices.

Finally if there was a battery that could do everything the OEM batteries could do at a signifigently lower price there would be none available cause the RC crowd would have bought them all already ;-)

My $.02

We don't use these things in the fields I have been in except for the older NiCd packs for 100W on camera lighting and camcorders in Broadcasting, and the manufacturers we stick to are a limited number of folks. Not going the NiCd route. Too expensive, low power and voltage, heavy and short life. I do have a few 12v batts from Bescor I have been using in my late evening listening sprees on the patio. If you want batteries with soft cases, take a look at them. They even have a new breed that's 14v. 12v is good but 13.8 would be great.

Well,
To alleviate my Yaesu FT-897 "AM" woes, I've decided to just put my HR2510 back in line for AM operation. The FT-897 is/was never known as a good AM performer anyway. I was just trying to run one rig in the shack.
The Heil GM-5 works great on the FT-897 for SSB & FM work. And I'm running a Turner +3 on the 2510, with great reports.
Thanks for all your input!!!!

Is that the blue and white Turner +3 handmic? I started radio with CB, and used that mic exclusively because of it's great sound. When I got my ham license and put a HR-2510 in the car, I found one at a hamfest and used it on that radio as well. That was a great mic and sounded great on both SSB and AM.

From: Simon Robinson
Topic: 31217 Message: 31217

Hi everyone

Is it possible to use the CAT interface (e.g. HRD) whilst also having the FC30 tuner connected?

It looks to me like an either/or situation.

Can anyone suggest a way round this or am I missing something?

Cheers

Simon M5POO

Yes. The CAT interface can share the mic port. You lose the up/down control. I use the rear port for a linear amp interface and I share the mic port between the mic and the CAT with a 3 way RJ45 adapter. It works great!

You need the LDG AT-597Plus Tuner. It has mini din computer port, so you can operate both the tuner and, HRD or whatever CAT software you choose.

I can also use the RJ45 jack on the Yaesu desk mic. It is a pass through of the mic port. Of course, I set the mic port to 'CAT'. I use the Yaesu USB interface to get to the computer ($39 with software that let's me back up the radio). I use HRD v5 beta. Then add a USB sound card interface (mine is SignaLink) and you have a digital station.

Hi All

Thanks to all those who helped me on the static crashes on AM, I have another one since I had the rig repaired by yaesu UK good turn around one week that was good. I have started to use the vhf and uhf side of the rig the sound off squelch is like an motor bikeish sound when antenna not connected it is the same NO readings on the s meter just the sound? receives ok but it is to me not right as I have 817 and vx8e they sound good af CLEAN back ground RF.
so is it another filter that yaesu missed!!

Thanks in advance.

31226. Audio Mute with HRD

Yahoo group: FT897 (2010)
Date: 2010-09-17 12:18:42 UTC
From: Aristotle Zoulas
Topic: 31173 Message: 31226

Hello gents, as you know the FT-857/897 suffers from the issue where the audio mutes when tuning the VFO through Ham Radio Deluxe. I was told by various people that this is an issue with the radio and not the software. Have there been any updates on this? Any way to reduce the problem.

For those unfamilliar with the problem: When using this radio with HRD alsong with CAT interface, the audio mutes when attemting to tune the radio through the software (slider control). It mutes for a fraction of a second but long enough to make it annoying to operate.

I was told by several members on this group and the HRD group, the issue is with the radio.

If there are any updates or if someone found some baud rate setting or other setting that eliminates the problem, would be nice to know about it.

Great program, great radio, significant problem.

73, Aristotle , W2ZOU

Topic: 31173 Message: 31227

Aristotle:
I have used HRD for about 3 years on both an FT-1000D and the FT-897D and have never run into this muting oddity.
Now that you mention it, both of my rigs act the same... a slight mute ONLY when using the slider control with HRD.
I never use the slider control to scan freq's so I never noticed the muting.
I have always used the frequency readout adjust as it is easier, faster and more precise.
I don't have an answer to the "problem" as I never use the slider control, but just wonder why, if it is annoying, why not use the readout adjust which is smoother and works the fine slider very smoothly and to the 3rd digit: ie 7.181.22(2)and no split second mute that I notice in either rig.
Try adjusting the freq's with the digital readout and see if that does not relieve the muting. My 895D doesn't mute at all this way.

From: vk2awj
Topic: 31229 Message: 31229

I use Ham Radio Deluxe to track satellites and also to automatically update doppler frequencies.

The open squelch is interrupted each time the receive frequency is updated. The period of these interruptions varies according to the chosen preset (0.2 up to 2 sec).

Is there a way to have automatic doppler frequencies and not to have the stuttering interruptions to the open squelch?

John, VK2AWJ

You might check the ambient temperature of your radio shack. Is the radio sitting on top of the power supply? Otherwise, I wouldn't worry too much about a fan that is doing it's job of staying ahead of the heat instead of trying to keep up.

Mike, I had same inquiry on this before, check the link http://www.remotepowerswitch.com/

This is a internet based power on/off switch device, very interesting, however, it can handle up to 10 AMPs(I remember), I have not set it up but this is absolutely is one option in case you need to remotely control the power. Hope this helps.

31234. Stuttering Squelch when HRD Satellite Tracker updates Doppler Freque

Yahoo group: FT897 (2010)

Hello John - I am interested in your posting as I hope to start using HRD with my FT-897D shortly. Can you also control the transmit frequency using HRD. I have read somewhere that the FT-897D will not allow the transmit frequency to be controlled from an external program like HRD? I will follow this thread with interest. Regards Allan M0CBG.

When using HRD and a CAT interface (I use the Yaesu package cable + backup software for $39), I can control a lot of the 897D's functions- including the band, frequency, modes, power outputs, ALC, squelch, FM gain, SSB mic gain, and a whole lot more. Not all of the functions can be controlled from a CAT interface. You can also set favorites and get one-click tuning to a band/freq.

You might check the ambient temperature of your radio shack. Is the radio

sitting on top of the power supply? Otherwise, I wouldn't worry too much about

a fan that is doing it's job of staying ahead of the heat instead of trying to

keep up.

Subject: [FT897] Fan is always on. Ideas?

Hi,

My FT-897D fan is always on, not just on transmit. I use the LDG AT-897 tuner

and even with that disconnected it always runs. Any ideas on how to set it so

it runs only during transmit?

Thanks,

Joey

Mine agrees with Roger's: The fans turn on at transmit, and turn off about 3-4 seconds after the rig stops transmitting. And, unfortunately, if I were to ding the 897 on something, it would be that the fans are annoyingly loud -- higher in pitch and in many respects more annoying than the fan on my linear. My former rig, a Kenwood TS-430S, had a thermostatically controlled fan that only ran as necessary, and it was so quiet you couldn't really tell it was on.

OTOH, at least in normal SSB and CW ops, I've never seen the 897 get even moderately warm, much less hot, so Yaesu must be doing something right as far as heat control is concerned.

BTW, I've been meaning to ask: I don't own a battery pack. Do the fans run on battery? I suspect not since (1) they're trying to conserve energy and (2) the PO is limited to 20W.

YMMV,

Yes I agree that the fan isn't really necessary most of the time. My Kenwood TS-440 was the same way as your 430, the fan came on during full power FM if you transmitted for more than half a minute or more, any less, and the heat sink took care of excess heat. And it was super quiet, I really had to listen closely to hear it. My 857 fan comes on immediately, even during SSB transmission before I even start to speak and the transmit output is zero, totally unnecessary. There is a hidden menu option in the hidden menu, (Hold down A,B,C buttons while powering up), called FTEMP, it controls the temp that the fan kicks on, but it seems to be more of a fan toggle, either turns it on all the time, or off all the time.

And another thing I discovered accidentally during a long winded FM QSO, is that if the rig gets excessively hot to the point that the fan can't keep the heat down, the display where it says "swr" for high SWR, and "dsp" when DSP is enabled, will display "hot" when the rig gets too warm. It still transmits, but displays "hot" to alert the operator that it's time to cool off. I think the amount of heat required to activate the "hot" display is controlled by the HTEMP setting in the hidden menu but not sure.

The fan is annoying when I operate QRP from inside my air conditioned house. On the other hand, my rig worked flawlessly during Field Day in the Texas heat. The rig was operated on CW at 100 W during the entire 24 hours period running stations at 25+ WPM QSK and at 100 W. The ambient temperature exceeded 103 F (40 C) for much of the time. The rig got warm but never too hot. The rig was also using it's own internal power supply. Not many rigs can survive this kind of use but the FT-897D was designed to be operated in the field.

It would be nice if the fan was totally thermostatically controlled so it would not come on if it wasn't too hot. I have a little temperature control switch that I thought about mounting on the heat sink and in in the supply line of the fans so they wouldn't come on with casual QRP operating. I could maybe wire the battery switch in to bypass the thermo switch if desired since I don't use internal batteries.

From: john_kb0ne
Topic: 31173 Message: 31241

Hi,
With regard to my FT-897D and HRD V5 release experiance:

What is happening in HRD is that it rewrites all the digits for the entire frequency and the audio mutes for a very short period (like a millisecond or so)every time the frequency is totally rewritten. This is somewhat annoying if using the scan feature or sliding the frequency bars back and forth rapidly on the HF bands.

Apparently this muting affects the main audio amp and not the upstream detection circuitry. One work around is to pull the audio off the low level audio jack on the back panel and run that through a second outboard amplifier.

Now here's the gotcha... the remote microphone (MH59) has the function to change frequency rapidly via the rotary encoder knob on the side... rapid frequency change via the mic does not cause the muting to happen. This mic also appears to be sending CAT commands via the "UP/DOWN" control lines (Note that the radio must be set for remote mic operation). It's my hunch that there are some undocumented CAT commands that tell the PLL to 'jump' in incremental steps as set by the coarse and fine tuning in the menus. Of corse theyse commands are not documented in Yaesu's CAT commands.

What needs to happen is to find out what these commands are and somehow get Simon to incorporate them in HRD.

Dear Hussain:
Thanks for the feedback, yes, as a beginner I just need to make sure it receives good signal for HF and I am using for 6M and U/V bands Tx. Also I heard you can actually ask for module for 14Mhz(20M) which was missing on the UHV-5.

Do you do SSB on 6M with this set up? how it works?

Something I noticed with HRD the other day while tuning around on lower bands is that there is a level of noise that comes into the 897D RX audio while tuning. It's a small increase in "white" noise level but when listening for weak signals, it's intolerable.

My comment on this one however might be that in this case it is likely hash from the laptop getting into the audio rather than a related issue with the muting you guys are hearing. It does happen to me too by the way. Tuning with HRD causes the same muting here.

Not sure there is a way around it and if there is it probably will mean a rewrite of HRD code bits to tune the 897D differently than the other radios he has built into the application. I still love it as it is quite a comprehensive application but there are issues that sort of get on your nerves. I haven;t tried other applications I'll admit because this one app has a lot of meat to it.

I'll be following the thread.

You didn't specify how you're connecting or what you're using as the interface or what software you're using, but a few things to check

1. Is there sufficient gain coming out of the computer and going into the rig. Almost always, when that happens to me or somebody I know, it's because the line out/speaker out/headphone out volume on the rig is too low. For example, you might have turned it down, or turned it off, because you were listening to something.

2. Do you have the correct soundcard selected in your software. Sometimes things get unset, especially if you're running Windoz and you accidentally brought up the software without all the cables connected.

3. Is there a gain on the interface that needs adjusting?

4. Does the input gain on the rig need adjusting.

I am assuming that you have the proper mode set on the rig (digital or packet if you're using the data jack, USB or FM if you're coming in through the mic jack). I'm also assuming that you've actually checked to make sure that the cables are seated properly and don't just appear to be correct.

Dave,

One suggestion, and I found this out the hard way, make sure your mic compressor is not on. If it is the 897 will not modulate the digital signal.

Chuck,

Please try another "non-switching" power supply like an Astron RS-20A or equivalent. Even a deep cycle battery if you have one about. These types of noise can be generated by many electronic devices. They can also change their frequency or repetition when affected by your transmitted signal.

31251. LCD display dims / fades

Yahoo group: FT897 (2010)
Date: 2010-09-18 21:51:14 UTC
From: Radio_Randy
Topic: 31251 Message: 31251

Hi folks,

During a recent outing, I noticed that sunlight entering the top front vents of the radio would cause the LCD display to fade out. This only happened when the light came from behind the radio and only at a specific angle.

Looking into the radio, I noticed a small window in the circuit board, directly behind the LCD, which appears to be sensitive to incandescent (and some LED) light.

I am not aware of an automatic dimming function of the LCD display on this radio. Does anyone out there know why this happens and if it's normal? Thanks.

Kim,

The antenna is probably fine for your use. If it will be a base antenna and not for a mobile, remember that you will need to add a counterpoise (ground radials) for it to work correctly.

Also, in the U.S., vertical antennas like this are used mainly for FM operation. SSB operation requires the use of horizontally polarized antennas like dipoles and such.

Hello,

I'm looking to buy a power supply for my new FT897. I've looked at some reviews and lots of power supplies either have noisy fans or create electrical noise that causes problems on the HF bands. I'm on a tight budget so what would be a good value "quiet" PSU?

Ian 2E0ZQR

If you purchased the rig, used, I would say it was a defect the previous owner knew about and decided to sell the rig rather than pay to have it fixed.

I don't have the manual in front of me, but I will assume that the radio operates much the same as my old IC-735 where the fan speed increases with temperature. It will also stay on longer after you stop transmitting (much like my FT-950 does).

I would say the radio has a problem with the fan control circuit. Whether or not you decide to have it fixed is up to you. The radio should survive just fine. It may shorten the life of the fans overall, though.

31257. Query re Frequency expansion of German market FT897D

Yahoo group: FT897 (2010)
Date: 2010-09-19 18:49:55 UTC
From: gerry_lawlor
Topic: 31257 Message: 31257

I have a German market 897D - serial number 6F70XXXX which currently does not allow TX above 7.1 MHz. From the serial number it appears to have been manufactured in April 2006. It has three links bridged - 1001, 1002 and 1008. None of the material I have found to date on the web seems to be directly relevant to this particular version - perhaps I have not looked in the correct locations.

Has anyone information on the link pattern that would enable me to expand the frequency coverage on transmit - particularly in relation to covering 7.1 to 7.2 MHz.

On a related basis - what is the best method to bridge these links - solder blob or something a little more refined?

Ian,

Personally I use an Alinco DM330MW. As a 2E0 it doesn't even break sweat (well no 25amp psu should). I've never heard the fan on mine.

Not the cheapest but it has a meter and a very useful preset setting, which I have set to 13.8v.

Absolutely no RF noise on HF receive that I can detect. I have not tried it on V/UHF as I have internal batteries.

It would seem by your post that you are looking at PS in other than ham radio sources .
Most places selling to ham radio , are going to offer PS without those issues .
Linear PS are generally going to be your best type , but usually cost more & weigh more - so shipping in going to add to price .
Switching PS [good ones that do not cause RF issues] Will be a little cheaper & lighter .
Just because something puts out 12 VDC [should look for 13.8 VDC] does not make it good for ham radio .
Aside from over charging-price , buying cheap is almost always going to be an issue .
Then it can depend on your location & finding used ?
Astron is probably the #1 source for both , linear & switching .
Lamda is good commercial used option .

Dear John,

I purchased a SEC 1223 switching power supply when I purchased my Yaesu FT-897 and I am very happy with it. Actually, I had a minor problem with one of the output terminals on the power supply and their customer service was outstanding.

Hope this is helpful.

Andy -

The original Shure 444 is a Hi Impedance microphone. You would want a later version of the microphone which is either Low-Z or dual impedance.

You can probably research (Google) the microphone or one of the group can give you the proper model of the Shure.

Although the Hi-Z version will work, you will not be happy with the quality of audio produced by the impedance mismatch.

Check and see if you may have hit the LOCK button on the front panel or mic. HRD doesn't normally take over the front panel and lock you out.

Hi Russell,
Go to menu mode 54 and unlock the rig. ALL must be selected to lock all the controls.
If you look on page 24 of your manual you will find this information.

Get an Astron RS-20A.

They're inexpensive (for the features), they're built well, they're easy to repair and they don't cause RF noise. The only downsides are their weight and the fact that they can hum quite a bit, depending on where you set it.

Regardless of what others will tell you, the RS-20A will power the FT-897D at full output, virtually forever.

If you feel that you absolutely must have more power...get the RS-35A.

I have a samlex 1235 and a Jetstream jtps28. Both are quiet on hf and seem to work well. The samlex is so quiet i can't tell it's on even in a silent room. I keep the jet stream in my ARES go kit because the fan makes some noise. In a busy emcomm room I don't notice it at all but it's distracting in a quiet room. The Jetstrem makes less noise than the 897 fan and is a great value I am just picky.

We've been using the Alinco DM-330MVT for almost a year now, powering two radios; the FT-897 and a Kenwood 271 2 metre which puts out 65 watts.
At times both radios are transmitting at the same time.
Great power supply, no issues whatsoever.

Hello Everyone,

It's sad that I have owned my 897D for a year and have zero QSL's. I need my building superintendent to babysit me while I install my horizontal dipole on the roof, and he finally is ready to oblige me. My quest to get on the air is almost at hand and I wanted to find out a few things, one being how to setup my 897D to run split frequency. I have the manual, but I can't find where it explains this, unless the manual is calling this procedure something different. Any help would be appreciated! Anything else you would like to add that you think would benefit my DX adventures, please shout out LOL!!!

Thank you,

73,

Jethro

One way to do that would be the button for the VFO - A & B , set the 2 frequencies in either , then just press the VFO button to go between .

From: Brian Forney
Topic: 31271 Message: 31273

Hi Jethro:

Assuming your manual is the same as mine, look on page 40. The split frequency operation section is between the WeatherFax monitoring and the active antenna sections towards the back of the manual. (It's kind of an oddly organized manual so no surprise you didn't find it). Essentially the menu row that allows you to pick the A or B VFO has a 3rd option "SPL" which lets you transmit using the frequency set in VFO-A and receive using the frequency set in VFO-B.

One cautionary note. Don't forget to get out of split mode when you are done. It is easy to overlook that you are in split mode when you come back to the radio later and wonder why no one is answering your calls.

its ham radio, much like marine things are more expensive :)

> KF7LDW
>
> I can get a good 10-12ah battery and charger for $100 most places? I
> know it's not built in and convenient but really...

there are some a123 batteries that people have indicated fit in the
unit, they give you a bit more power. Others have used tandy/radioshack
batteries of the same form factor and cut the cost dramatically.

The only thing special is the (documented) connector pinout. This makes
it easier to make your own. There are two connectors, internal to the
radio and external for charging. A clever person could wire this up
without much effort.

31279. i2c eeprom dump

Yahoo group: FT897 (2010)
Date: 2010-09-24 13:27:10 UTC
From: Bret McDanel
Topic: 31279 Message: 31279

I will return home in 2 weeks and dump the eeprom at that time as well as monitoring the i2c bus to see exactly when things are committed to clear up any doubt about when this happens. I will also be looking to see what else is on the i2c bus, if anything.

If someone beats me to it I will be glad to look at the microchip 24LC128 dump while I am still away. Contact me off list for a way to transfer the dump file if you can provide it. I am eager to work on this and dismayed that my radio is 12,000 miles away currently :/

I do not want a CAT dump, I have that, I want to rule out the CPU from hiding anything on that chip as well as verify what it contains. It is believed by me and some others that the 24LC128 eeprom contains the configuration settings, alignment data, memories, etc.

If you have i2c tools (like the $30 'bus pirate') and want to do this, the eeprom is under the top cover. Open the radio like you are performing a mars/cap mod. Orientate the radio so that the jumpers are at the top left, just under the jumpers is an 80 pin CPU, just down and to the right from that is an 8 pin IC (mine is slightly raised from the chips next to it). The IC should be marked with the microchip logo ('M') and 24LC128. If you have a different prom I would appreciate hearing about it along with serial number prefix (date code) and what chip is there.

Thanks

Have not been on 6 for 30+ years. When 6 is open, it is one crazy band. 1 to 2 thousand miles is possible. I just read that in June of this year the midwest US was open to Europe.

>Thanks for advice, Randy. For FM on 6M, does it follow the line-of-sight like 2M or it has better skip or propagation close to HF? I checked with some local HAMs and their feedback it is good for short to middle range within the same town under FM mode.

31282. potential wearing of PROM with CWID

Yahoo group: FT897 (2010)
Date: 2010-09-26 07:54:21 UTC
From: Bret McDanel
Topic: 31282 Message: 31282

This is a potential issue, I have asked Yaesu for clarification. For now I will let you know what I know ...

This is not something most people will have to worry about. It takes a special kind of user to ever run into this problem, if it even exists. I think over 99% of users will never run into this problem, but it is something to be aware of.

This issue appears to affect the FT-817, FT-857 and FT-897 radios, I do not know about others, but these 3 all seem to do this particular thing the same way. Given what I know about some other Yaesu radios it might affect more.

Again, because people love to quote out of context, I will repeat the disclaimer that I do not think most people will experience this problem. I am only mentioning it so that people are aware in case they are the small tiny percentage of people that would come close to having this problem.

CWID is not stored in the normal EEPROM that everything else is. It is either stored in the CPU ROM or some as yet unidentified (by me) EEPROM. I believe it is in the CPU ROM for a variety of reasons, if you really care hunt for posts from me Sept 2009 talking about CWID on this group for why. The data sheet for the CPU states that you can only write "up to 100 times". If the CWID is stored in the CPU ROM changing it too frequently can cause you grief.

The only scenarios I can envision where someone would regularly change the CWID (enough to hit the 100 cap) is that feature being used for contests and a group ID is used (and then it would have to be frequent contesting, different IDs and possibly set back after the contest), multiple users of the radio who love that feature, or someone just changing it because they can. As I said I do not think that it is that common but it is something to be aware of if you use that feature.

Appears marginally cheaper. I think I'd probably be better off with a 14ah battery and charger though for these costs. Kind of feel like I should have bought the 857 instead for the smaller form factor if I don't use the bay for P/S or batteries.

Thanks for the replies.

Topic: 31275 Message: 31284

I guess that depends. I was looking at buying the 857 for my shack. This is a shack only rig, not going in my vehicles. After playing with the 857 and 897 at the Orlando Hamcation, I chose the 897 because the display was easier to see, and the buttons were more spread out and easier to use. They are electrically identical, so you might have still made the right decision.

I do want to eventually add the batteries in mine for ARES/RACES use, but haven't yet because of the cost. This had no bearing in my choosing the 897 over the 857, it's a recent thought.

Like so many things it really depends on what you want to do. I purchased the w4rt batteries for my 897 so that I could just grab the radio and go. For receive only each battery last me about 6 to 8 hours. This and a small solar panel are small enough for me to lug up to the top of a mountain for some fun. If you plan to operate from a fixed and easily accessible location you can buy a lot more battery power for your money elsewhere.

Kim, I have the UHV-5 on my truck right now for 2 & 440 use. Originally used it for 6 meters and HF. The best 6 meter contact was mobile Colorado Springs to Hawaii. I never was able to get results with the HF coils installed. I removed the HF coils and use it for 2 & 440 only. I have a screwdriver ant. now for HF. As far as 6,2,& 440 use it has always been a great ant. My HF problems may have been where I have the ant. located. The ant. does need a perfect ground to work well. Hope this helps.

Thanks for advice, Randy. For FM on 6M, does it follow the line-of-sight like 2M or it has better skip or propagation close to HF? I checked with some local HAMs and their feedback it is good for short to middle range within the same town under FM mode.
Thanks and 73s

Kim,

I operate mainly 6 meter SSB and haven't worked an FM repeater for several years. My opinion is that frequent "long distance" contacts on 6 meter FM will have to wait for increased sunspot activity. However, don't let me discourage your attempts. Radio propagation is like the weather where sudden changes are almost impossible to predict.

Give 6 meter FM a shot. It will give you plenty of opportunities to improve your setup.

Seems insane to me too. Upgraded to General Sat 25, 2010 (Last Saturday) and finally got on HF - 20m was my first stop. I mentione this because I was working folks in the Texas QSO Party and in Calif. using 25w and a dipole made from 2 20m Shark (Cheapie) mobile ships on a 9AH Gel Cell on my patio.

Since we are talking batteries, I wanted to mention this one. . .
I have been using Bescor battery packs for my video and film gear for years now. They recently put out a 14v gel cell and charger. You can get the details here:
http://www.bescor.com/Export8.htm

I sent them an email telling them they need to advertise to Hams. We are looking for the perfect battery here and this one is close. I mentioned that if they did target the Amateur market that they should add Power Poles as an option but, I have loved their stuff for a while now. Honestly the 12v cells we can get almost anyplace but their packs and options made it easy to use this weekend. If you really want to walk and talk with the 817, they make battery belts for video guys that might be great. I am not associated with these guys in any way. Just pointing out the option there. If anyone tries one before I do, let me know how it goes. I bet you get longer run times than a 12v batt.

From: pbarge@att.net
Topic: 31295 Message: 31295

Hello All,

If this has been asked before my apologies in advance. I would like to connect my new FT-897d to my old Heath SB-220 amp. I have found some spotty info about changing a jumper and using the acc jack to key the amp, however no "how to" documentation. Any of you gurus have this info? Also, once this is set up, will there still be a need to have an optical interface between the two to protect the keying circuit of the rig?

Thanks!

Pat

31296. How accurate is the rf power output selection

Yahoo group: FT897 (2010)
Date: 2010-09-27 03:18:59 UTC
From: William
Topic: 31296 Message: 31296

This is K5WCF and I was wondering how accurate or precise is the rf output selection. the reason I ask is I enjoy running SSB voice on my 897d on the 5 watt setting and using a manual mfj tuner out to a inverted v wire dipole about 15 feet or so up, and I would like to know if this is true qrp operations or is it putting out more than the 5 watts that the selection shows. I have gotten real good reports from various counties in Texas, and from other states most recent W. Virginia. I am new to HF and want to be correct in saying I am operating QRP at 5 watts. The cross needle on the tuner reads 15 watts forward when tuning up, but I am not sure what that translates to in terms of actual SSB operation. Any help or info regarding this question would be appreciated.

Thanks in advance and 73

Alan,
I had this recently; not being able to resolve it I unplugged everything, and after switching on all was fine. Plugging the stuff in again: blocked.
The culprit was my CW keyer which had an internal hangup of PTT (cannot explain why).
Resetting that box all was fine again.

Yahoo group: FT897 (2010)
Date: 2010-09-28 09:48:55 UTC
From: Dennis
Topic: 31296 Message: 31298

Well, this depends on a few things..... first - what model tuner are you using? Most MFJ tuners' meters are notoriously in-accurate. The really only way to be sure about power out is to have a true test meter or other "accurate" meter in line to test with. Most of those meters are going to be expensive brand-name meters such as 'Bird', etc (other names escape me right now - it IS 4 in the morning here :-)).

Next, this will also depend on on how well the radio was tuned at the factory before it was shipped and (to a small extent) the type of finals and other circuitry in the radio. Seems that Yaesu changes some components from time to time for various reasons. Also may depend if the radio is new or used, and if used, did the prior owner do any work on it, mess with the settings (service menu), etc. Lots of variables here.

However, on a guess, I would say the power out (on a NEW-from-factory rig) is probably accurate to about 3, maybe 4 watts, give or take.

Sorry I couldn't be more help. Maybe someone else is more knowledgeable than I in this arena, but I can only relay what I have seen and heard at this point.

Pat,
The default keying on an SB-220 is *not* compatible with the FT-897.
The SB-220 employed a 120VAC relay. You'll need to either retrofit a
12V relay into your SB-220 or use something like the ARB-704 between
your rig and your amp.

The FT-897 was designed to key an amp from a pin in the CAT receptacle.
The ACC receptacle provides ALC to the amp, as well as "Transmit
Request", which causes the rig to transmit a carrier for tuning.
While this may have made sense to the Yaesu engineers designing the
rig to support Yaesu mobile antennas and tuners, it is problematic
if you intend to use the CAT interface and an amp at the same time.
Since most folks don't have a need for TX REQ, at least in non-portable
setups, on later rigs Yaesu provided a internal jumper option on the
rear of the top board which allows one to substitute TX GND for TX REQ
on the "ring" lead of the ACC connector. I've been told this was
effective starting with lot #25. If you take the top off your FT-897
and find your rig indeed has this jumper (J1027), located near the rear
of the rig betwen the ACC receptacle and DC power jack, you can move
the jumper to the TX GND position and then wiring the FT-897 to an amp
or ARB-704 becomes quite simple: Just plug a stereo "Y" splitter into
the ACC jack. The red side (the one that connects to the "ring" on
the 3.5mm "ACC" plug) then goes to the keying circuit on the amp or
ARB-704, while the white lead (the one connected to the "tip") goes
to the ALC, if you use it. (You'll probably not want ALC with your
SB-220.) That's how I have mine connected to my AL-80B, and it works
very well.

Good luck,
Rob

31302. FT 897 - Self Oscillation on 70 cm

Yahoo group: FT897 (2010)
Date: 2010-09-28 21:43:41 UTC
From: Allan
Topic: 31302 Message: 31302

Hi guys,

I have an FT897, which until now only have been used occasionally on HF. After having installed new antennas I have experienced self oscillation on 70 cm on approx. 436 MHz. The TX is transmitting a continuous wave at full power even in SSB mode. Also in RX mode self oscillation occurs on a couple of frequencies around 436 MHz. It appears to work FB on two meter without any problems.

Anyone have an idea where to look for the problem? J

OZ5XN, Allan

Since it seems to be related to the new antennas (and probably doesn't
do this into a dummy load), I'd guess RF feedback and a grounding issue.

31306. During reception, I hear a kind of cracking / scratching noise.

Yahoo group: FT897 (2010)
Date: 2010-09-29 09:38:47 UTC
From: klokkenman
Topic: 31306 Message: 31306

Sorry, I don't know the English words for the problems I have with my 897, so a description follows.
During reception, I hear a kind of cracking / scratching noise.
Mostly when the signals are beneath S9. Stronger signals remain untouched.
It seems like the transceiver struggles with strong signals nearby, that are disrupting the signals on the other bands. I can't find any of them. But during reception with no antenna connected, there is no problem.
I also have a lot of fading during reception in UHF. Just like the AGC is pushed down.
My station is located about 100 meters away from an GSM antenna installation. But those signals are far out of range for the FT-897.
I installed an 2000Hz Inrad 455KHz SSB filter, but unfortunately no improvement at all.
Is this a common problem for the FT-897? I own the transceiver for about 2 years now, and had never any problems of this kind. Except for reception in AM mode.
I recently relocated my transceiver to the other site of the room, and used a few couplers to extend my transmission lines.

31307. how accurate is the SWR meter?

I'm playing around with building 2M antennas and wondering how accurate the built-in SWR meter is. My "real" antenna is a mobile tri-bander and the SWR numbers are low (as I expected) but I'm kinda surprised that the first ground-plane antenna I built has even lower SWR numbers on 2M.

Ground plane antennas are very close to 50 ohms when the radials are dropped down 45 degrees from the horizontal. So the swr is close to 1.1 to 1. I have also made 3 element cubical quads for two meters which worked very well. Paul KB2VEC

The built in swr meter is a relative reading meter. There has been hours of discussion here on this forum on this exact issue. It, (as most are) is just an indicator of SWR. It's not too accurate although it gives the user an indication of problems with the antenna.
When you build antennas for a radio that costs about $900 it's best to get an accurate outboard meter. The FT-897 has saftey features built in, but if you want more accuacy an outboard meter is your best bet. Building your own antennas is a great idea, but invest in an SWR meter.

While I agree with Bill's recommendation of an accurate SWR meter (I have them on my radios), if you plan to tinker with antennas, you need to invest in appropriate antenna analyzer(s). At some point you will have one that isn't right and this will help you solve the proble whereas the SWR meter won't be of much help.

31317. Re: How accurate is the rf power output selection

Yahoo group: FT897 (2010)
Date: 2010-09-29 17:36:01 UTC
From: faygopaygo
Topic: 31296 Message: 31317

I think that this is mainly a question of the difference between a full duty cycle signal like FM or AM and a partial duty cycle like SSB. When you tune up using AM or a key down CW mode You get a true full duty cycle reading, in your case 15 watts. When you are using SSB you are only getting an average of the power output because it varies too fast for the meter to register correctly. The real power output is probably varying between 0-15 watts with an average around 5. So the question is, are you legal QRP. The answer is, who knows? The second question is, who cares? The answer is, you. If it bothers you that you may be breaking the QRP power limit then don't announce you are at QRP levels. Also, I'm not sure but I believe that QRP power for SSB is 10 watts or less. Somebody correct me if I'm wrong. Finally I just go by what ever the manufacturer states in their specs. For the 897 lowest power for SSB is 5 watts. That's what I consider QRP, so I use lowest power and the QRP designation when CQing. I may be lucky, but so far I have avoided prosecution by the QRP police if that's wrong.;-)

I am not sure if you should use full duty or partial duty readings for SSB power output when stating your power designation QRP,QRO for contests and such. Can anybody help me with that?

Hope this helps,

Randy
KG6WCA

--- In FT897@yahoogroups.com, "William" <wcforeman@...> wrote:
>
> This is K5WCF and I was wondering how accurate or precise is the rf output selection. the reason I ask is I enjoy running SSB voice on my 897d on the 5 watt setting and using a manual mfj tuner out to a inverted v wire dipole about 15 feet or so up, and I would like to know if this is true qrp operations or is it putting out more than the 5 watts that the selection shows. I have gotten real good reports from various counties in Texas, and from other states most recent W. Virginia. I am new to HF and want to be correct in saying I am operating QRP at 5 watts. The cross needle on the tuner reads 15 watts forward when tuning up, but I am not sure what that translates to in terms of actual SSB operation. Any help or info regarding this question would be appreciated.

I work at a local radio shop and the techs are telling me the Samlex and Jetstream are good ones. I actually bought the Kenwood KPS-15 (very gently used for a steal) yesterday and a quick eval last night with the 897d sitting on top of it with no antennas, I scanned 6m, 2m, 20m, 40m, 80m and found no appreciable noise of any kind on any freq.

Note that I have heard from many folks and found some minor documentation that agrees, the Samlex 1223, the Kenwood KPS-15 and the Yaseu (unknown model number) are actually the same PS. This is the 23 Amp supply. I figured if Yaseu and Kenwood think it's good to go, the Samlex must be OK. And the price point is a lot lower (name recognition)

See this link for more including drawings and tech manual:

Hello Everyone,

I have been lurking here for a year at least, but finally got my superintendent's permission to put up my horizontal dipole on the roof of my 3 story building. Anticipating this new adventure, I wanted to load up the frequencies that this antenna will hopefully pull in. The dipole is setup for 40-10 meters, so I wanted to program the beginning and ending frequencies, I think subtracting or adding 3 Mhz? so that I can scan between the two values! Well I'm just learning the 897D and I followed the manual to the letter, but when I rotate through all the memory channels it goes from Ma-01 to Mk-5u!!! Where are my M-PxL/M-PxU!!! I know I'm new to this equipment, and my ex-wife can attest that I am as sharp as a bowling ball, but I think I'm not the problem here! Any advice and help is welcome and truly appreciated. Since I have been waiting over a year with this radio and no antenna, in less than a week, I might have my first QSO...Imagine That!!!

73,

Jethro

Maybe I don't understand what you are trying to accomplish. You're going to scan discrete frequencies that are stored in scan memory? What if the "scanning" just passes by the frequency when it's momentarily not transmitting? Have you ever considered using that big knob in the center of your radio to "tune" through frequencies slowly, while you listen for a signal? Just an idea- -

Yep, I know about the big knob, I'm truly disappointed that all I got was a condescending facetious reply. I expected more from this community. I wonder why they added that feature if the had that big knobby thing there anyway?

Probably for the sake of VHF/UHF repeaters, and the fact that some people store a dozen or so of their favorite net frequencies in the 897 for faster recall.

Scanning HF SSB or CW Frequencies is almost an act in futility. The 897 isn't really very good at that, because when doing weak signal work, you'd never use a squelch. In order to do what you're describing would mean just that, tightening down the squelch and hoping you get a big signal that would break it.

Dave,

Thank you for the explanation, as you can see, I have a lot to learn. Now that you have brought to light the issue, I won't try and take the shortcut's. Though it still doesn't explain why those channels aren't there. I appreciate your time Dave , Thanks.

73,

Try without antenna to check if the problem comes from the receiver or from the antenna.

Sorry, I don't know the English words for the problems I have with my 897, so a description follows.
During reception, I hear a kind of cracking / scratching noise.
Mostly when the signals are beneath S9. Stronger signals remain untouched.
It seems like the transceiver struggles with strong signals nearby, that are disrupting the signals on the other bands. I can't find any of them. But during reception with no antenna connected, there is no problem.
I also have a lot of fading during reception in UHF. Just like the AGC is pushed down.
My station is located about 100 meters away from an GSM antenna installation. But those signals are far out of range for the FT-897.
I installed an 2000Hz Inrad 455KHz SSB filter, but unfortunately no improvement at all.
Is this a common problem for the FT-897? I own the transceiver for about 2 years now, and had never any problems of this kind. Except for reception in AM mode.
I recently relocated my transceiver to the other site of the room, and used a few couplers to extend my transmission lines.

Also, once this is set up, will there still be a need to have an optical interface between the two to protect the keying circuit of the rig?

Pat,
The default keying on an SB-220 is *not* compatible with the FT-897. The SB-220 employed a 120VAC relay. You'll need to either retrofit a 12V relay into your SB-220 or use something like the ARB-704 between your rig and your amp.

The FT-897 was designed to key an amp from a pin in the CAT receptacle. The ACC receptacle provides ALC to the amp, as well as "Transmit Request", which causes the rig to transmit a carrier for tuning. While this may have made sense to the Yaesu engineers designing the rig to support Yaesu mobile antennas and tuners, it is problematic if you intend to use the CAT interface and an amp at the same time. Since most folks don't have a need for TX REQ, at least in non-portable setups, on later rigs Yaesu provided a internal jumper option on the rear of the top board which allows one to substitute TX GND for TX REQ on the "ring" lead of the ACC connector. I've been told this was effective starting with lot #25. If you take the top off your FT-897 and find your rig indeed has this jumper (J1027), located near the rear of the rig betwen the ACC receptacle and DC power jack, you can move the jumper to the TX GND position and then wiring the FT-897 to an amp or ARB-704 becomes quite simple: Just plug a stereo "Y" splitter into

the ACC jack. The red side (the one that connects to the "ring" on the 3.5mm "ACC" plug) then goes to the keying circuit on the amp or ARB-704, while the white lead (the one connected to the "tip") goes to the ALC, if you use it. (You'll probably not want ALC with your SB-220.) That's how I have mine connected to my AL-80B, and it works very well.

Good luck,
Rob

From: David Okrent
Topic: 31307 Message: 31333

I agree with the rest that an antenna analyzer is a must have when building an antenna or at the least an SWR meter. However, unless you are building antennas all the time investing $250 or so is hard to justify. I have owned one in the past. One solution is to join a local ham club. Often they have some equipment, like an antenna analyzer, they will loan out on a few days at a time basis. You might also get an Elmer to help out.

When using an amp, that connector is setup different and the CAT signals are not present. Some amps have a secondary CAT port. However, the CAT signals can be set to come out of the mic jack. I have used a RJ-45 splitter to accomplish this with HRD.

I use my amp and control box on the rear port. When this port is set for the amp, it is not available for CAT control. Hence using the mic port on the front in its dual mode function. The same is true if I use the Yaesu tuner.

31339. RE: [FT897] FT 897 - Self Oscillation on 70 cm

Yahoo group: FT897 (2010)
Date: 2010-09-30 17:36:24 UTC
From: Chet S
Topic: 31302 Message: 31339

Hi Allan,

I had a problem with this too about a year ago.

When I changed some cables, my 897 transmitter developed a spurious oscillation. If I put the radio into transmit mode with a /PTT, but no key closure, the output should have been zero, but it was transmitting a signal varying from 1-3 watts at an unknown frequency. Waving my hand over the radio or holding some of the cabling could occasionally get it to stop, but not consistently. I finally narrowed it down to the 432 MHz bandpass filter section on the main pcb. A slight adjustment of one of the trimmer caps in that area got rid of this parasitic.

Good luck,
Chet, N8RA

Subject: [FT897] FT 897 - Self Oscillation on 70 cm

Hi guys,

I have an FT897, which until now only have been used occasionally on HF. After having installed new antennas I have experienced self oscillation on 70 cm on approx. 436 MHz. The TX is transmitting a continuous wave at full power even in SSB mode. Also in RX mode self oscillation occurs on a couple of frequencies around 436 MHz. It appears to work FB on two meter without any problems.

Anyone have an idea where to look for the problem? J

This sounds like a bad crystal filter. And it appears to be somewhat common. I had almost the same symptom. Thankfully the radio was under warranty. Yaesu replaced a crystal filte and, two surface mount components. If you disconnect the antenna and the noise is still there, this is likely your problem.

I've seen this problem posted here several times.

  Subject: [FT897] During reception, I hear a kind of cracking / scratching noise.

  Sorry, I don't know the English words for the problems I have with my 897, so a description follows.
  During reception, I hear a kind of cracking / scratching noise.
  Mostly when the signals are beneath S9. Stronger signals remain untouched.
  It seems like the transceiver struggles with strong signals nearby, that are disrupting the signals on the other bands. I can't find any of them. But during reception with no antenna connected, there is no problem.
  I also have a lot of fading during reception in UHF. Just like the AGC is pushed down.
  My station is located about 100 meters away from an GSM antenna installation. But those signals are far out of range for the FT-897.
  I installed an 2000Hz Inrad 455KHz SSB filter, but unfortunately no improvement at all.

Is this a common problem for the FT-897? I own the transceiver for about 2 years now, and had never any problems of this kind. Except for reception in AM mode.

I recently relocated my transceiver to the other site of the room, and used a few couplers to extend my transmission lines.

31344. Re: No PMS Channels?

Yahoo group: FT897 (2010)
Date: 2010-09-30 22:09:22 UTC
From: mchenryproj
Topic: 31321 Message: 31344

Jethro,
The previous reply is correct but perhaps a little short on the "why" part, a little.

In order to scan, the channel has to have no noise at all on the freqs in question, like when a 2 m repeater or simplex FM channel is squelched, not just inactive with white noise on it. The easiest way for a radio to sense an active channel is to listen for something breaking the squelch when it checks that frequency. That's fine in FM and local but in HF, you are usually trying to pull in weak signals at an equal level with that background noise sometimes. If the squelch is set to high, you will never hear that station, a bad way to operate in HF as you could decide nobody is on the freq and try calling, right on top of someone else. Squelch is not often used in HF for those reasons.

To scan channels or frequencies, you would need to put the squelch on or the radio will simply sit on the very first frequency it tries to scan and never go anyplace, since it would be hearing that background noise.

I think you can see how scanning HF is an issue now. You can sort of get away with it but the background level will change from day to day, heck, even moment to moment. Usually squelch is only good for FM services. Am can do it if the radio looks for carrier rather than a certain noise level but it's an issue there too normally. Don't forget most HF stations have flutter and fade due atmospheric conditions and you might get it to work until a station drops below the squelch level then the scan would start again. If you were scanning a whole band, like 440 SSB, it will be a while before the radio cycles around to that freq you were listening to again and if the station is in the background noise level or happens to not be transmitting - you miss them for yet another pass.

Hope that helps with the reasoning. Sounded like you were looking for a "why" it won't work answer and that might help out. As for why the channels aren't showing up... maybe the radio won't let you set those on HF? Haven't tried it myself. Good luck.

I'm curious. You said it had no other symptoms but did your output power change during a transmission at all? SWR jump around? Anyone tell you is sounded like you were dropping in and out while talking? Just wondering if it might have been a bad internal antenna connection?

Just curious. Seems like nothing serious would be fixed for $71 as the bench fees alone are at least that. If it was a solder joint I could see tossing only the bench fee at it, or if it was under warranty maybe but it soulds like yours was out of warranty. Sure would be nice of them to fix it for you as a courtesy. That happens and we are all grateful when they do that, and many companies do that for us.

Hi Sean,

My problem was only on receive, TX was fine. I would get loud static crashes when receiving 2m signals. The noise was so bad at times it would completly drown out all stations. I benched the radio with a good power supply and my base station 2m antenna to elimanate all possible external sources of the noise. I suspect that it is the reported filter problem. I did not test very well on HF as this radio was in my vehicle and it has only limited HF antenna capabilities. I would not be supprised if it was a $1.00 part and $70.00 (one Hour) labor cost. Looks like it may be tomorrow before UPS deliveres the radio. Vertex shipped it back on Monday.

Hi All,

Re the antenna analyser, (I know this is a little off topic) there's a club in VK who are doing a kit version of an analyser for a cheaper price than the MFJ, and in my opinion it's every bit (if not better) as good as the MFJ.

Visit http://www.scarc.org.au, and click on the projects link. The design is that of Jim, VK5TR (some of may know him as VK5JST)

Price is (AU) $150 for international, or $135 for VK.

Cheers

Simon

I agree - an antenna analyzer is very useful. Sometimes, on the last day of a Hamfest, if you're lucky, you can pick up a MFJ-259B for close to $200. Don't forget the MFJ-1312D power supply ($15.95) so you don't have to use batteries. Good Luck!!

there are some a123 batteries that people have indicated fit in the
unit, they give you a bit more power. Others have used tandy/radioshack
batteries of the same form factor and cut the cost dramatically.

The only thing special is the (documented) connector pinout. This makes
it easier to make your own. There are two connectors, internal to the
radio and external for charging. A clever person could wire this up
without much effort.

From: Bret McDanel
Topic: 31358 Message: 31358

I am looking for transverter options. A google products search returned little of value. Basically I want to weigh my options of what is available, any band that the ft-897 does not support is welcome. A vendor name is appreciated, a model number, possibly link to a place that sells them and input/output requirements are even more helpful.

So what is out there and who makes it?

Thanks

The SWR meter on the rig is telling you just that, what the SWR is at the rig, AFTER the tuner has matched the antenna to your rig. That's the reason the SWR meter "goes nuts" while you tune, you are seeing the tuner in the process of selecting the right match for the antenna. In order to really see how well your antenna resonates, you need either an outboard SWR monitor (Autek makes one), or an actual antenna analyzer like the MFJ units.

Hi Sean

No power or SWR problems for as far as I could measure. Depending on the internal SWR indicator of the rig. I can only check it with an external power meter on HF, and no problems there either.
I checked the internal soldering to the antenna connectors inside the rig, and it looks like that's fine.
But I do have some fading in my transmission signals on UHF as well.

This sounds like a bad crystal filter. And it appears to be somewhat common. I had almost the same symptom. Thankfully the radio was under warranty. Yaesu replaced a crystal filte and, two surface mount components. If you disconnect the antenna and the noise is still there, this is likely your problem.

I've seen this problem posted here several times.

My best!

  During reception, I hear a kind of cracking / scratching noise.
  Mostly when the signals are beneath S9. Stronger signals remain untouched.
  It seems like the transceiver struggles with strong signals nearby, that are disrupting the signals on the other bands. I can't find any of them. But during reception with no antenna connected, there is no problem.

I also have a lot of fading during reception in UHF. Just like the AGC is pushed down.
My station is located about 100 meters away from an GSM antenna installation. But those signals are far out of range for the FT-897.

I installed an 2000Hz Inrad 455KHz SSB filter, but unfortunately no improvement at all.

Is this a common problem for the FT-897? I own the transceiver for about 2 years now, and had never any problems of this kind. Except for reception in AM mode.
I recently relocated my transceiver to the other site of the room, and used a few couplers to extend my transmission lines.

Right, I figured that was the case. But it also drops to 1:1 on VHF,
where there is no outboard tuner. Maybe I just built a good antenna? :-)

I am looking for transverter options. A google products search returned

little of value. Basically I want to weigh my options of what is

available, any band that the ft-897 does not support is welcome. A

vendor name is appreciated, a model number, possibly link to a place

that sells them and input/output requirements are even more helpful.

So what is out there and who makes it?

Thanks

> If this has been asked before my apologies in advance. I would like to connect my new FT-897d to my old Heath SB-220 amp. I have found some spotty info about changing a jumper and using the acc jack to key the amp, however no "how to" documentation. Any of you gurus have this info? Also, once this is set up, will there still be a need to have an optical interface between the two to protect the keying circuit of the rig?

When mine did this, I noticed that the "noise" would start at S1 and slowly increase over a few minutes until it reached S9.

I hope you get it resolved. The 897 IS a darn nice little rig. Perfect for us non powerhouse stations who enjoy simple and pleasurable QSOs

Best!

ps,mine too was just out of warranty. I think a month and day or two. It was still repaired under warranty. And with excellent turn around time.

This sounds like a bad crystal filter. And it appears to be somewhat common. I had almost the same symptom. Thankfully the radio was under warranty. Yaesu replaced a crystal filte and, two surface mount components. If you disconnect the antenna and the noise is still there, this is likely your problem.

I've seen this problem posted here several times.

My best!

It's my first one! I'm used to doing metalwork at +/- .005, surface mount soldering chips and making exact scale models and wasn't sure how fine the tolerances need to be on a ground plane antenna. I think I'm +/- 1mm or so and that makes me nervous. :-)

31368. 897 power levels

Yahoo group: FT897 (2010)
Date: 2010-10-03 01:55:40 UTC
From: scotchmandr
Topic: 31368 Message: 31368

I currently own an 817 and am debating an 897 for those times at home when a bit more power is useful. HOWEVER I love the fact that all my Yaesus have an easy button to toggle through power levels.

If I get an 897 it will move between functions and therefore be changing power levels. 5w indoors, 20w mobile, and 100w occassionally.

I dont see an easy way to do this?

Help?

Once you under the menu it is fairly simple the rig is easy to use. read the manual and if you can have the rig set up so you can read the settings and go through the menu at the same time before you go on the air write down the menu # of what you want to do..
will make it much easery.. DE Barry VE3BLM

HI Philip,
I have a FT897D and as i need to up the power sometimes all i
do is to leave the rig in mem #75 , so to changed power all you have to do
is PRESS the F Function button BRIEFLY to get #75 showing in the display
then u just rotate the selector knob to reduce or increase power / You could
also use the VFO A and B
for say A for indoor and B for mobile settings or what ever you wish

31371. Wiring Of Shure 444 Mikes For FT897

Yahoo group: FT897 (2010)
Date: 2010-10-03 12:01:55 UTC
From: OHM
Topic: 31371 Message: 31371

Thanks to everyone who replied to my last posting.

Just inform everyone i now have a Shure 444 and wired it up to the FT897. I did not use a transformer that was advised.
I can report it works very well with nice crisp clear audio.
I have changed Menu setting No 48 to HPF.
On 6M,2M,70CM FM Menu 48 could be changed to BOTH this makes it less toppy.
So next time you go to a Rally don't Poo Poo Shure Mikes as hold hat.
They still work just as good or better than other well known mikes.
In some cases a lot cheaper too.

Andy G6OHM

31372. Spare control pin?

Yahoo group: FT897 (2010)
Date: 2010-10-03 12:27:02 UTC
From: Geert Jan de Groot
Topic: 31372 Message: 31372

I need to add functionality the radio currently does not have:
mix the TX audio to the speaker audio, so that when I run with
a lot of headphones in parallel (which will be the case for the
upcoming JOTA), the kids can hear what the other kid is transmitting.

I would like to enable/disable this feature by use of an "unused"
setting so I don't need to open the radio every time.

I notice that the 4094 shift registers have their unused outputs
terminated as solder tabs, but no way to control them it seems.

Anybody have a smart idea on how to "steal" an unused control pin
to enable/disable this? An inside control pin is positively good enough.

Geert Jan

31373. Re: 897 power levels

OK, plus I read in the manual... You can set one of the quick-menu items (row 17 I beleive). So you could set 17A to F-menu item #75. Then do as you suggest. Thank You

> If you are talking about menu item 10, yes it is.

I do not know if it is memory item 10 or not, I do know that the CWID
does not appear in the eeprom when you dump it and others who have
worked on the FT-817 have reported the same thing. The 817 has a very
similar memory layout.

If you know where it is please share that information.

Not much is posted about the 897 or 857, most people that have this data
seem to be keeping it secret for some reason. Why I am publishing a
full memory map when I am finished. I cannot find it anywhere in the
dumps that I have done.

http://www.ka7oei.com/ft817_meow.html
The setting of menu item #31 (The CW ID) doesn't seem to be stored
anywhere in the EEPROM - it was not to be found even in an EEPROM read
via an outboard programmer. It is possible that this is stored in an
available on-CPU EEPROM.

31375. Re: [FT897] potential wearing of PROM with CWID

Yahoo group: FT897 (2010)
Date: 2010-10-04 04:54:09 UTC
From: Dean Gibson AE7Q
Topic: 31282 Message: 31375

The only reason I responded to you last week and now, is that you issued (in my opinion) a completely bogus warning about damaging the CPU EPROM (after you chastised someone else for a similar bogus warning). I don't know if you have been annoyed at my replies, but I was sure annoyed by your statement. This is not the first time someone has posted a bogus "alert" about the FT-897D; look at the following FAQ regarding 60-meter operation on Yaesu's site, which was a response to a bogus "alert" posted here (and elsewhere; the poster peppered the Internet with his misunderstanding) several years ago:
http://www.yaesu.com/indexVS.cfm?cmd=DisplayProducts&ProdCatID=102&encProdID=0372FA803B7BBADBF3076C94ACA7A8C5&DivisionID=65&isArchived=0
-- My understanding is that the original poster's "alert" hurt FT-897D sales for a very short while. This problem is not limited to Yaesu or even amateur radio; however, now with the Internet, it's possible for one person to post what looks like a really knowledgeable statement (as I recall you posted some credentials a couple weeks ago), and it can really hurt a company's sales (and that means higher prices, guys). In amateur radio it's even worse, because so many think they know more than they do. I've been in the software business for 40+ years, the last 25+ in embedded software, and _*EACH_YEAR_* I know a much *SMALLER* percentage of the technical advances out there.

I am providing you with the following information, only to prove my point: The CWID is not stored in ASCII; it is stored using the following translation table, probably to make Morse code lookup during playback easier:

static char const morse[] = "0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZ /!+.";

In other words, my callsign would be stored as (hex) 0A 0E 07 1A. I'm not going to tell you where, do your own work before you make such statements as you did.

The same encoding is used for other information (ie, the three beacon text strings, AND OTHER INFORMATION) in the EEPROM. Valid information (detectable by changing values & dumping) extends through at least location 0x1CEC, with no gaps. Just because you can't find something, doesn't mean it isn't there.

People aren't finding stuff because they are making a *_LOT_* of assumptions while searching for values. You have to dump memory, then change ONE thing in the radio, dump memory again, and then compare the two dumps. The above was easy to decode with the right technique. It's a lot of work, which is why people aren't willing to just hand out the format and then have someone else profit from it. The GPL applies to code and protects it, but there's little or zero protection for reverse

engineering efforts (including someone just examining GPL source code for technical details and then writing new code).

Copyright protects code, but doesn't protect engineering efforts. Patents do, but they are expensive. Years ago, I developed a data compression technique for a company. The technique was implemented in copyrighted code, AND the technique itself was patented (# 5,049,881 -- despite the almost universal Internet commentary that this covers the LZRW algorithm, it was NOT an implementation of LZ techniques !!!). Some scum (masquerading as software engineers) took our product, reverse compiled the code, and inserted it into their own product, which then sold in the PC marketplace as a very popular disk compression product. If that was all these scum had done, they never would have been detected. However, being greedy little bastards (and not knowing that the technique had been patented), they then tried to license the source code to others. Unfortunately, when they reverse compiled the code, they inserted comments to the limit of their pathetic understanding, like "we don't know why this is here, but it works" (and it's not like it was all that complex). During the attempt to license the code to someone else, they allowed the code to be superficially examined, and the prospective buyer was suspicious of the originality of the code. Since the data compression industry was very small, it wasn't hard for the prospective buyer to find out where the code really came from. The ensuing lawsuit over the patent involved a high-speed car chase by a sheriff as a process server, with the target of the chase crashing his car and running off into a field to avoid process service. End result: the company was sued into oblivion (we took all their profits, and they were out of business).

I'm not a big fan of software patents (even though I have two), but in this case it were used to effect some small measure of justice.

I don't have an FT-817, but I'll bet the same encoding is used for CWID, and I'll bet it's right there in the EPROM, using the same encoding. Check it out, and let us know if the statements about the FT-817 are correct or not. You owe that to Yaesu.

-- Dean

ps: KA7OEI says, regarding locations 0-3 of the FT-817:
/
/

/If the contents of these addresses are changed, the '817 may detect a checksum fault and completely wipe EEPROM contents, erasing *all* "soft calibration" parameters, configuration settings, and memories. *You have been warned!*/

The value in 0-3 is not a checksum; it's a constant "signature", and if it is changed, the firmware assumes that the memory has been corrupted. This is a virtually UNIVERSAL convention in the usage of EPROM memory, including firmware ROMs, like on every adapter in the old IBM PCs. The

POST code in IBM PCs would search the adapter space for such signatures
to find valid ROMs, and then transfer control to them if the signature
was valid (a different application of the same concept).

of course you wont say where.

I am not the only one saying this, the FT-817 memory map also says the same thing. We both think it odd that the CWID is stored outside the EEPROM data that is normally used for this data. It is also odd that Yaesu uses the CWID on at least some models (VX8 I know specifically) to enter a freeband mode. Meaning that you set the CWID to a secret setting, reset the radio and the function is changed.

> People aren't finding stuff because they are making a *_LOT_* of
> assumptions while searching for values. You have to dump memory, then
> change ONE thing in the radio, dump memory again, and then compare
> the
> two dumps.
really? like what I said on this list, like what I said on my blog documenting the memory of the radio? Glad you have said that, I would never have been able to figure that out on my own.

I did that, and am continuing to do that. I also am getting the firmware off the cpu, I am monitoring the i2c bus that the eeprom is connected with looking for other specifics. Because I publish specifics not vague comments and insist that someone else is wrong about something, but specifics.

If you are so sure I am wrong, why not post the memory address that the CWID is stored at. failing to post that kinda means you are not disproving my statement you are just saying mean things about me and doing so way later. Like you have some grudge against me for something.

> The above was easy to decode with the right technique. It's

my blog its free. FT-897/857 memory map. The ft-817 is free as well published for all the world to see.

So you are wrong, people do just hand it out.

> I don't have an FT-817, but I'll bet the same encoding is used for
> CWID,
> and I'll bet it's right there in the EPROM, using the same encoding.
> Check it out, and let us know if the statements about the FT-817 are
> correct or not. You owe that to Yaesu.
>

http://www.ka7oei.com/ft817_memmap.html

there is not enough space on the map for the cwid to be shoved in
anywhere. Its just not there. If you can find it please, provide the
address rather than just saying its a secret and you wont tell anyone.

I somehow magically owe it to Yaesu to prove you right, you somehow do
not owe anything to me when you claim I am being evil (which I am not)
by making information public you refuse to make public.

1. you owe me a public apology
2. if you cant prove me wrong dont say I am wrong
3. when you claim to have secret data and just know something but refuse
to give it out, you should not comment on said data as a source

since we are making lists of what people owe.

Why don't you set the CWID to KC2DWQ (that is your callsign, isn't it?)
and see where 14 0C 02 0D 20 1A shows up ???

I would have thought with the Morse encoding table information I
provided, that you would have tried that before responding.

> So you are wrong, people do just hand it out.
>

Some do (although in this case their information is incomplete).
However, I value my time and expertise and am not willing to give it
away in the case of the FT-897. I do in other cases (eg, I have
provided the memory layout/values of the ID-880H to KK7DS), and have
helpful amateur web pages as well as you do.

> there is not enough space on the map for the cwid to be shoved in anywhere.
>

The web page you refer to only documents up to location 0x1908, so that
leaves plenty of undocumented space in an 8K PROM.

> ... you claim I am being evil (which I am not) by making information public you refuse to
make public.
>

I made no such claim. I suggested that before you warn people about
wearing out their EPROMs, that you have your facts straight. Especially
after you did the same thing to someone else a week earlier.

If you (or anyone else) will send me a complete 8K EPROM hex dump of the
FT-817 with your callsign programmed as the CWID, I'll look in it, and
tell you where it is. I just won't do it for the FT-897D.

you said I should apologize to Yaesu for damaging their sales. I think
that is classified as being evil.

The fact is that you are just being a bit silly about this whole thing.
You claim to value your time but you are spending far more making
allegations against my character publicly, insulting my intelligence and
related things. I am through with this conversation unless you are
going to give out the memory address I am going to have to stand by my
comments and the comments of others who have reached the same conclusion
and published their work. Anyone can make claims and base those claims
on secret unpublished works, in my case I am making my work known.

Hey folks, what about this setup? This appears to be very similar in setup to the W4RT system down to the rapid smart charger. 13.2vdc, 4500mAh NiMH battery pack WITH the charger for about $70 per. That's 2 packs and 2 chargers for $140 total.

You might have to reconfigure the batteries but a good fast hot solder job and your there.

http://www.batteryspace.com/nimhbatterypack132v4500mahsmartfastcharger18aforbikelightstrailtechplug.aspx

Comments?

Also, I think I mentioned this in a few places but not sure about here yet, Bescor now sells a 14v GelCell in a nice nylon pack with fused leads. I have been using their 12v batts for my film and video stuff for years. If anyone tries one before I do let me know what you think. When the 12v pack goes I'll be moving up to a 14v version.

if i remember the original packs have one more cell- something like
14.4 volts
the 13.2 volt cell drops and you loose output quickly

i am certain that someone can verify this

Since the batteries do not fit into the radio , there is not much appeal to me , and the lower voltage 13.2 vs 13.8 , it would seem that a little less performance .
I bought the radio for many reasons , one that having batteries in the same container was what I was looking for .

I second the DEM comment. There used to be others in the field of Transverters but I can;t find many listed now. Most transverters you might be interested in are naturally for the ranges we are not able to hit with the 897d, like 220MHz or the upper VHF and SHF ranges like 1.2Ghz, 2.4Ghz, 3.7Ghz, 5.6GHz, 10GHz and 24Ghz. DEM is not cheap but I have always heard they were good and they have decent power output from their kits to get you actually started on the air. I still have a 1296 transverter made with their 1196 LO board in my garage. Not much happening above 440 here and most of that is FM.

Good luck and happy hunting. I believe there is an article here on the list about stuffing a 220MHz transverter in the battery compartment of the 897d.

From: mchenryproj
Topic: 31275 Message: 31385

The Yaesu and W4RT packs are 13.2v. See this link:
http://www.ft897.com/Batteries

Don;t be fooled by the W4RT comment about their initial charging voltage of 15+ vdc. All the packs will show a no-load initial charge of higher than their load rating of 13.2vdc. 11 cells at 1.2vdc is 13.2vdc.

Also, since the initial voltage rush with a full freshly charged pack is 15+ vdc, I suppose then the system could survive 14vdc Gel Cell or 14.8 from the larger packs then, I think.

Point on the sizes being that the cells are the same size in the RC pack I mentioned they just need to be reconfigured instead of that funky triangular package they are in. That package fits into a water bottle and is used as a substitute battery pack for bicycle night lighting, hence the triangular shape. Rework that pack for the cells to fit and I think you have the same pack as the W4RT is what I was going for. I probably didn't explain that part well.

where would I stuff my batteries then? :)

It would have to be external, and odds are I wont be using it when
portable so that shouldnt be much of an issue.

Thanks for the suggestions, I will look into them.

Sean,

Having looked at the site I would steer clear of these batteries. From what I see the pack is limited to a 5 amp max draw and only 2.2 amps continuous. This is fine for a bike lamp or maybe the FT-817 but for the 897/857 I would be hesitant to run more than 5 watts out. There are very few free lunches in the battery world. The packs by Yaesu and W4RT may seem expensive but the batteries they use are designed for heavy current draw(read expensive). Get the W4RT pack if you want a Yaesu equivalent at a better price. You can also save by buying a RC charger and doing the needed connector swapping. As I have stated in other posts if you're going to spend 3 to 4 hundred bucks, I'd go with RC power rated LiPoly or A123 batteries. (check out the Buddie Pole site for great info and product on A123 packs) You'll spend nothing to maybe up to 100 bucks more but you'll get full power operation and lighter weight. Lipoly life span may not be quite as good as the NiMH though. You may have to do some hand fitting to make them fit in the battery well of the 897 or just use them externally. They're small and light enough to not make much difference if they're in or out! There have been many posts on this subject before. Do some searches and you'll find much info and how to's in the file section.

Randy
KG6WCA

Check out RC power packs. You want your pack to handle at least 5-10 amps CONTINUOUS for power up to 20 watts and 22 amps continuous for full power ops. RC motor packs can do this with both hands tied behind their back and blindfolded. They'll pull 30-100 amps continuous.

> Chuck
>

Well, that's how it's coded on the FT-897D, which was KC2DWQ's question. It certainly could be different on the FT-817, which is why I made my offer to look, if someone will send me a dump of the entire 8K EPROM (or, if you are local to Seattle, bring your FT-817 over to my house for ten minutes). I will publicly disclose the results for the FT-817.

The memory maps of both KA7OEI (for the FT-817) and KC2DWQ (for the FT-897) stop at the end of the channel memories. There's several menu items stored beyond that on the FT-897D (I can only guess for the FT-817).

It's not like I haven't tried to find out for the FT-817. Today I considered uploading a crippled copy of software I wrote five years ago to dump the contents of Yaesu radios. Then I remembered what happened five years ago when I requested (*on this forum*) beta testers to run it on their FT-817 radios, and report back the results. I had two volunteers (I still have their names) who claimed they had FT-817 radios, and I communicated with them off-line to make sure they would actually run the simple program and report back the results, Both agreed that they would, and I sent them the software.

Despite repeated reminder eMails, not only did they never report back the results, but they never even responded to my reminders. The sad part is, I had planned to release memory control for the FT-897 and FT-817 software (including source) under the GPL.

So, if some of you out there think I'm a bit of an *!@#$%* [insert your own favorite word], you may be right. I just want you to know where I'm coming from.

Sincerely, Dean / AE7Q

From: Eric van de Weyer
Topic: 31372 Message: 31389

Hi Geert Jan,

Why don't you just make up a simple external box which does the mixing for you? Just take a feed from the microphone and that from the speaker or headphone output, appropriate amplification and then feed them into an amplifier which then feeds the multiple headphones.

Running multiple headphones directly off the radio may be too much load for its amplifier anyhow so using an external amp would be a good idea.

You could even do it by using a separate microphone in front of the operator which picks up the local sound and mixes it in with the headphone output from the radio thus not requiring any connection to the radio's microphone.

73....Eric VK2VE.

-----Original Message-----
From: FT897@yahoogroups.com [mailto:FT897@yahoogroups.com] On Behalf Of Geert Jan de Groot
Sent: Sunday, 3 October 2010 23:27
To: FT897@yahoogroups.com
Subject: [FT897] Spare control pin?

I need to add functionality the radio currently does not have:
mix the TX audio to the speaker audio, so that when I run with
a lot of headphones in parallel (which will be the case for the
upcoming JOTA), the kids can hear what the other kid is transmitting.

I would like to enable/disable this feature by use of an "unused"
setting so I don't need to open the radio every time.

I notice that the 4094 shift registers have their unused outputs
terminated as solder tabs, but no way to control them it seems.

Anybody have a smart idea on how to "steal" an unused control pin
to enable/disable this? An inside control pin is positively good enough.

Geert Jan

Peter, I just had that happen the other day. Put your thumbs on the center of the dial, pull the rubber grip off with your fingers. You will see a hole on the side of the knob and you will need a 3.5 mm hex wrench. Unscrew the nut and pull it off.

I just grabbed the spring type thing and twisted it to the right and it tighten it right up.

Hope that works.

Mine broke too! I repaired the plastic piece with the threads with duper glue., but it didn't last very long. Download the FT-897 tech manual (or maintenance manual). Google it or go to Yaesu.com. You have to order the whole tuning knob assembly. They won't just let you order the actual broken part by itself. I don't have the part number handy because I'm not any where near the computer that has that PDF file. When you get it, look on the exploded parts view page and you'll see the knob assembly with it's part number.

Unfortunately, even though I have two FT897s (one "D", one non-"D"), I don't think either of their boxes have survived a couple of moves. I want to use a real 897 box to ship it in, so it has the proper packing. Does anyone have a spare box they would be willing to part with, or do I need to contact Yaesu?

Ask Yaesu to send you appropriate shipping material. There maybe a fee of course.

I have read about a couple people doing this.
http://mysite.verizon.net/cpthaines/id28.html for example.

afaik (I would be very interested in hearing if this has been remedied)
no one has a PTT solution that uses the bluetooth button (like the vx8
has). I will be looking to put a 857 on my motorcycle and the interface
is the same as the 897 so that works out well, for me at least.

The reason you would want the button on the BT device to toggle Tx is
for battery consumption, you really want the BT device to not transmit
anything unless and until there is a need for it.

31400. Occassional "winking" of "HISWR" indicator on 80 - meters...Danger???

Yahoo group: FT897 (2010)
Date: 2010-10-07 16:02:09 UTC
From: pascalpete
Topic: 31400 Message: 31400

I have an FT-897D with the LG AT-897Plus tuner and am using a G5RV-jr antenna. While I know this antenna isn't "rated" for running on 80-meters, I recently re-aligned the antenna and just for kicks tried tuning up on 80 meters to see if it could tune up (it never could before while I had my antenna in an "inverted V").

Low and behold, it actually tuned up...BUT...I get "three blinks" out of the auto-tuner. Three blinks means that my SWR is 3 to 1 or higher.

My interest on 80 meters is actually a traffic net on CW. I tried a voice call (understanding that my match is not great) and every so often while speaking I see the "HISWR" indicator start to appear but ever so faintly (it starts to display and then disappears...like I am JUST on the verge of what it considers unacceptable). Most of the time it is not visible...just every once in a while there is this "hint" that it is starting to come on. It is a very quick flash that never reaches full intensity on the LCD display.

I then slid the dial down to the CW range and played with sending a few dits and dahs (with the required call sign of course) and I noticed that I SOMETIMES see the "HISWR" just barely start to fade in...then out again if I send a long string of dashes (never on the dots). Again, this is a very quick "flash" of the indicator that never reaches even full intensity on the LCD (it is very fast...I can barely make out that it is starting to display). It appears rarely on CW.

Of course, the correct solution here is to put up an antenna that is rated for 80 meters...but I might not get to it before the snows hit here in Michigan. So my question is...just how good is this Hi SWR protection circuitry?

1) If I try to do only CW on this antenna...where I rarely (but some times) catch just a hint of the HISWR indicator, am I risking damage to my radio?

2) If I reduce power (I am running on 80 watts right now...could probably get by with less on CW) will I reduce my exposure to disaster?

3) Am I just being stupid with an $800 radio and should never ever operate anywhere near a 3-to-1 SWR? Just find a way to put up another antenna?

If there is pretty much no risk I may just go ahead on CW only for a while. If there is any risk I'll probably wait until I can get the full sized G5RV installed.

This weekend I am proud to celebrate a full year as a licensed HAM radio operator and greatly appreciate the experience and advice or more seasoned operators.

Thanks in advance for any information you can share.

Peter,

The SWR protection circuit is good but not perfect. It takes several cycles of RF at full power before the circuitry can tell that the SWR is high and reduces the output to a safe level. Although a 3:1 probably never hurt anything, I would say you are taking a risk. The "High SWR" indicator is kind of like the blinking OIL light in you car. ;-) You probably have a little while before your engine burns up.

Peter,
I operate on 160m a lot, and I cannot count the number of times we encounter someone with an extremely weak signal breaking in to get a signal report. When pressed, they very often say they are using a G5RV which, on a lark, they found they could tune up on 160, and thus they "discovered" they had the ability to operate there. But, for practical purposes, they don't. A standard G5RV is terribly inefficient on 160m. Probably 95% of the power is being lost in the tuner or in the coax. Your G5RV-JR is undoubtedly behaving much the same way on 80m.

If you want to get on 80m with your antenna, here's what I'd suggest: Short both legs of your G5RV-JR together and feed it against ground. Unless you happen to have been extremely unlucky with the length of your feed line, I think (1) you'll notice the tuner is able to do a much better job of tuning the antenna in this configuration, and (2) people will actually hear and come back to you with a decent signal report.

As far as whether a HI SWR indication is bad for your rig, well, the rig is supposed to fold back to protect itself. However, it's seeing a lot of power being fed back, and thus the finals are being stressed. I've inadvertantly keyed my 897 into short and open circuits, and it survived. And, any time the tuner is tuning, the rig can momentarily be seeing some pretty hefty SWRs, at least initially. (I've seen the HI SWR indication flash while tuning.) I suspect the rig should handle it in stride, but I wouldn't want to press my luck with a prolonged

operation into a HI SWR load. But, YMMV.

Good luck, but before I went forward in your current configuration,
I'd try feeding your G5RV-JR as a top-loaded longwire against ground.

Good luck,
Rob / KD8WK

Peter,

Personally I think you are taking a big risk. I was in a similar position to you and just wasn't going to take a chance.

In theory when the indicator is on you should be reduced to 20 watts but who knows when that will be in the indicator cycle.

Take a look at the G7FEK website about what you can do with a G5RV/2. I can thoroughly recommend it. I didn't actually destroy my aerial to build one. I used wire I had to hand. It took about 4 hours to get it up and tuned once I had worked out where the supports would be.

Performance is excellent. My AT897 can match all bands 80-10. It is now my main HF antenna. Can't wait for the winter. I am hoping for some 80m DX. I had no trouble with QSOs from 29 miles outwards this spring/summer on 80.

Steve,

Thanks for the info. Using your OIL light analogy, it is clear that I don't want to risk this.

You see, I worked in the auto industry for over 15 years as a software developer on vehicle diagnostic systems. From that work I have, for myself, realized that the only reason "OIL" is on that warning lamp is because "ENGINE REPLACEMENT REQUIRED" is too many letters to fit in the same space and still be readable.

Applying that same logic to this situation, I have no desire to play Russian Roulette with my radio.

I'll work on getting a taller mast.

Thanks again.

Rob,

Thanks for your input. I am taking from the responses that I would be taking a pointless risk, even if it is a small one. Since I already own a full-sized G5RV (just have some installation issues to contend with), I will not try working 80 meters until I find a way to get it installed.

Again, I appreciate your feedback.

Colin,

Thank you so much for the info, especially about the G7FEK website antenna. I took a look at it and I find it very interesting. I probably won't go to that since I already own a full sized G5RV sitting in a box in my office. I don't have that antenna up because of a problem getting it installed due to its larger size. If I cannot solve that problem, I fully intend on taking a closer look at this other antenna.

Thanks for your help.

Hi Eric,

Thanks for your suggestion. However, an external box would add clutter and
would duplicate functionality already available (the built-in audio PA
can handle half a dozen headphones easily).

Thing is, there already is a nice mic amplifier and a nice audio PA,
just need to connect them together.
Also, I really want the audio passthrough only to work on TX - there
will be 4 stations in the room running concurrently (we'll have 6 stations
next week) and I don't want to add local noise to a possibly noisy
connection with unexperienced ears.

What I'll probably do is mod the main board and make the feature
selectable by internal jumper, like I've done ith other radios
This means opening up the top lid, but that's that I do on my
other radios. Just hoped I could avoid this, oh well.

73,

Geert Jan

Eric,

Even if you manage to achieve your goal I think that you will find that it will be more trouble than it is worth!

On radios where the facility is available, such as the IC7000, it is a freature that is always turned off because as soon as you stop using headphones it inevitably causes feedback on transmit, so you are forever adjusting the volume control betweenm transmit and receive to stop the howling!!!

Jeff

Jim: Thanks for sharing, the other hams have adviced me to get a ground radial for improving the performance in case I use for base mount, which i intend to do for the bands this antenna supports. I am not a experienced HAM for HF and only ground radial I could find is the one that can be connected to the base of the antenna and the mount for lightening protection and gain improvement purpose(a three elements ground radial), does this help to get the performance better for the UHV-5 if I mount it on my apartment roof rather than on the car?
Thanks and 73s

This will not answer your question, Sean, but a bit of ancillary data:

I use the hand mike, a Labtec LVA-8420 boom headset, and a Blueparrott B250XT bluetooth headset with my 897, and the hand mike consistently comes in third when I ask people to judge them. That's not to say it's bad, but people I talk to prefer the other two to it. (The LBA-8420 comes in first.)

YMMV,
Rob / KD8WK

LinkedIn was started as a business/professional networking site (notice that I have omitted the words "social networking"), for professionals to use EXISTING business/professional relationships to contact "friends of friends" (so to speak) to establish business/professional contacts.

Unfortunately, quite a few LinkedIn members view it as a social networking site (which it is not), and there is even a term for such people: "LinkedIn Open Networker" ("LION" -- check Google). Many of these persons try to get as many people as possible in their network, WHETHER THEY KNOW THEM PERSONALLY OR NOT. Some even view it as a contest.

LinkedIn tries to prevent this with certain validation procedures, but it is a losing battle. When it occurs within LinkedIn (using LinkedIn's internal invitation mechanism), there is a way to mark it as spam, but there is little you can do when receiving it here.

LinkedIn is OK (but not great) for what it does. It has groups that can be set up for members that worked at a particular company, or graduated from a particular school, etc. Unfortunately, those groups have become overrun with professional spammers repeatedly (like every week) hawking products. I'm the owner/moderator of one group for ex-employees of a large company where I used to work, but we all lost our jobs about ten years ago when the company went out of business due to the "dot-com" crisis.

I would LOVE to give up moderating the group, but if I put up an announcement asking for volunteers to take the group over, there is one "LION" in the group that might volunteer, and he would just open the group up to anyone who claimed to know someone there. I occasionally get such requests, and if I can't validate that they used to work for this company, they don't get in. Result: no group spam.

>stock MH-31 hand mic? Better sound?

This will not answer your question, Sean, but a bit of ancillary data:

I use the hand mike, a Labtec LVA-8420 boom headset, and a Blueparrott
B250XT bluetooth headset with my 897, and the hand mike consistently
comes in third when I ask people to judge them. That's not to say
it's bad, but people I talk to prefer the other two to it. (The
LBA-8420 comes in first.)

YMMV,
Rob / KD8WK

From: Hank
Topic: 31410 Message: 31418

I did and I get great audio reports. I didn't have any trouble with my hand mic, but I have gotten unsolicited comments on how good the audio sounds with the MD-100A8X. I looked at the Heil mics as well, after all, they are outstanding mics. But the Heil cost the same as the Yaesu, but I also needed to buy the mic stand and cable, bringing the cost out of what I could afford at the time.

One thing to note with the MD-100A8X. You MUST turn the switch on the bottom of the mic in the bypass position. I worked for a month trying to get this mic to work with my 897, even contacting Yaesu for help. Then while looking at the paper that came with the mic, I saw a small note that I had missed when reading it for the first time. It states that the switch must be off for the FT-897 and a few other rigs. As soon as I put it in the bypass position, that mic came alive and I have been very happy with it since.

Hope this helps.

31419. FT-897D with Kantronics KPC-3+ locked on transmit

Yahoo group: FT897 (2010)
Date: 2010-10-04 18:50:55 UTC
From: Rich H K7RFH
Topic: 31419 Message: 31419

Recently switched over to a KPC-3+ with my FT-897D. Everything was looking good until my first transmit test. After that every time I connect the data port cable to the TNC, the FT-897 immediately goes into transmit mode and does not release.

Does anyone have advice for this one?

I could not find anything about that problem in this group.

Thanks.

31420. Re: [FT897] Box for FT897?

just go to UPS and they will pack it in bubble wrap anyway and it will be fine. there are times if you ship to yaseu they will not send back the same box it came in anyway.

To: yaesu@..., FT897@yahoogroups.com
Date: Wednesday, October 6, 2010, 9:17 AM

I need to ship my FT897D back to Yaesu for service (high noise floor on 40

and below). Unfortunately, even though I have two FT897s (one "D", one

non-"D"), I don't think either of their boxes have survived a couple of

moves. I want to use a real 897 box to ship it in, so it has the proper

packing. Does anyone have a spare box they would be willing to part with,

or do I need to contact Yaesu?

Thanks,

Ken

Sean,

I have and use both. I don't get many comments about improvement on HF (not active on HF very much yet), but my friends tell me on VHF/UHF there is a huge difference, so if you use VHF/UHF it is definitely worth it. On HF it is more convenient to not have to hold the mic, and I believe the transmit sound quality is better, even if not many people have said so.

31422. Re: Remote Power Switching for FT-897D

Yahoo group: FT897 (2010)
Date: 2010-09-26 14:55:45 UTC
From: n8kpa
Topic: 31148 Message: 31422

Hi, all...

CAT isn't used by the MH-59 for everything - there's three dedicated lines in the cable for UP/DOWN and FAST. Take a look at pg 12 of the manual for the pinout at the rig.

Now, how the radio implements the signals from the mic is a completely different thing. Internally, it's certainly true that these same lines are sampled by the microprocessor under control of the imbedded software, which acts on the input to change states.

"CAT" is how Yaesu has chosen to expose specific functionality to its users via a serial data interface. This includes the internal code that reads and writes to the serial interface.

Yaesu has implemented a couple of additional layers of access via the serial interface. First is the service/alignment interface, and the last is an exposed area in the flash memory, with a generic CAT command to read and write to it. Best site I've seen that describes this is at: http://www.0xdecafbad.com/

Here's my first point: Yaesu designed and coded all this, and they're not new at it. If they don't want functionality exposed, it won't be exposed, unless they screwed up. I beleive they made a design choice to mute while tuning, and the code implements it in a clunky way not to our liking.

And here's my final point: these design choices were made years ago. The rig was introduced in the US at Dayton in 2002. It was sold in Japan a year before that. The design cycle for these things is (or at least was) typically 3-5 years. So that means the design spec is circa 1996-98 at best. I bought a very popular synthesized Sony SWL receiver, an ICF-SW100, at that time, and it was known for the annoying "chuffing" noise it made when tuned up and down. It's not surprising that a cutting-edge rig designed at that time muted when tuned: it was considered a "feature". PSK31 was announced in '98, so I bet that the designers didn't and probably couldn't foresee the degree of digital integration we enjoy and expect today.

The 897d version was actually designed at the same time; pretty much all the extra functionality was available as optional extras on the 897 at introduction.

So we're all playing radio with a software and hardware design that pretty much dates to Windows Millenium Edition...Hopefully Yaesu has made enough profit off it to encourage their new Motorola owner/partners to let them introduce a killer FT-997, or some such, Real Soon Now.

Till then, I still love my 897d, with the Collins 2.3 filter, AT897, the OK1FIG white noise mod (http://ok1fig.nagano.cz/FT897D/FT-897D_LessWhiteNoise.htm), and lots of menu tweaking!

73, and see you on the bands.

Topic: 31426 Message: 31426

Hi Folks,
I need help a friend of mine has an FT-897 and it just got back from Yeasu for cold solder joints. I am trying to dump all his frequencies back into his radio with no such luck. When I try to receive from the radio to the computer I get an error, and when I try to send to the radio it does nothing except to hang there, no movement of the bar that indicates downloading. I've checked the connection cable to make sure it is secure, with the same results. I am not using a serial to USB converter so that is not an issue either. Does anyone have any suggestions to remedy my situation?

No, it comes with two standard 1/8" stereo plugs appropriate for a computer sound card (one for the mic and a second one for the headphones).

I bought mine from W2ENY, and it came with an adapter for the 897. I don't think the adapter would be too difficult to make for yourself from the end of ethernet cable, though.

One more comment on this headset: Although it works great on HF, I've found it susceptible to RFI on 2m, at least on the 897 here.

Wow! Lots of variables there. First off, you might want to consider the FT-857, the mobile twin of the FT-897, for your application, since two of your three uses are mobile. If you are going to be operating portable, I would highly recommend a Buddipole system. If you're operating mobile, I would think a screwdriver of some sort. If you have the real estate and trees, for fixed base operation, I would recommend a Windom type wire antenna. I have made many Windoms for under $40, and they're a good, versatile antenna.

Hello,,,,,,

You have mentioned using the FT897D as a base, mobile in car, and on your boat...

The more suitable radio for this would be the FT857D, as the 897D is more expensive as it allows using a battery pack installed for portable use,,, and you have not specified this in your post.

The FT857D comes complete with a mobile mounting bracket, and you can 'find' another spare bracket for fitting in the boat, the 857, also has the advantage of the remote head separation which is a boon for mounting the radio under a seat, or in the trunk... allowing you to leave your car with the control head in your pocket.

I am probably biased as I use my 897 as a base, and my 857 as my mobile, only drawback with both radios is no built in DTMF facility for working echolink and some repeater linking, which is useful, if you need this, or as a selling point when trading up...

For portable operations we use a Chameleon V11 antenna, it does all bands including 2m and 440.
We haven't used it on VHF/UHF yet, I think you have to take out the 9:1 balun to do so.
We took said antenna on holiday a couple of weeks ago, we rented a cottage w/o internet and used the chameleon not only
for QSOs on voice but also for digital modes to cheque and send e-mails using the radio and a laptop.
Made DX contacts on 17, 20 and 40m and connected to digital RMS stations for e-mails on 80, 40 and 20m.
We have the antenna on a 5ft tripod and 3 5ft masts. Antenna comes w/4 20ft radials, we added 2 more for good measure.
This Friday we are hosting a digital open house with two portable digital stations operating and one VHF portable digi station as well here in MidCoast Maine.

> Thanks, Paul KZ0P

Paul, If you are looking for a headset/mic I have the Proset Plus, it has both the elements in it HC4 for DX and HC5 for regular rag chew. If you are looking for a mic only I have and would suggest the HM10. It also has both elements in it. My opinion is to get something that offers both the elements. They are not that much more as far as $$$ and than you have 2 mics in one. I also have and like the Travler Dual Side headset and mic combo.

From: kb1syv
Topic: 31437 Message: 31437

Hello Everyone,

I have a headset that has a y cable that plugs into the mic jack so I can use the headset mic on VOX. I followed the instructions in the manual, to go to Menu 40 and then momentarily press "F" key and use mem/vfo knob to select other options. Well for me, when I momentarily press the "F" key and use the vfo/mem knob, it just goes on to the next menu. It doesn't take me to where I can turn the VOX on. Any advice on what I'm doing wrong?

Thanks,

73,

Jethro

Press and hold the "F" key till it beeps. if you just press it, it will
only change the function keys.

Hold down the "f" key till it beeps, then turn the mem/vfo knob to the vox
menu, then use the big tuning dial to change.

Jeff, I don't know why my other post didn't post, but I get to menu 40 no problem. According to the manual, there is a sub manual off of 40 you get to by momentarily pressing the "F" key again. Problem is, it's not working. It's located on page 58

I got that far, but there is a sub menu according to the manual to turn VOX on. By the way, I was a central office technician out in CA for 13 years, mainly DMS 100, 250, 500 and all transmission.

Thanks

73,

Jethro

Try to go to "MFd" and activate VOX (press C) and from MENU MODE #088 set gain for MIC and from #040 for DIGITALS modes if you did not have CAT.

When u get to menu option 40, you turn the tuning dial to change the value from 0 to 100. It tells you how to also turn the regular vox off when using the digital vox. when you press the "f" key again, it rotates the function keys on the bottom of the display, turn till vox is there, then press that function key to turn vox on/off. If you are using a headset, you don't have to mess with the digital vox. Just turn the vox on by momentarily pressing "f", look at the very bottom of the display, turn the mem/vfo knob till it shows vox, then press and hold that function key till the vox is activated. You don't have to fool with the digital vox setting, as this is for digital soundcard modes.

You turn on VOX by momentarily pressing the F key and then selecting
Multi-Funciton Row "d". Alternately, you could press the DSP button
and spin the MEM/VFO knob 5 clicks clockwise. Pressing the third
button "C" will toggle the VOX on and off.

If you press and hold the VOX button "C", it will dump you into
Menu 088 where you can adjust the VOX GAIN using the main tuning knob.
The VOX DELAY (selectable from the MEM/VFO knob and adjustable the
same way) will be one click away. Press and hold the F key to exit
Menu Mode when you are done.

Thank you for your help everyone, I got it finally. I was trying to do the momentary "F" while in menu 40. I hadd to be out of the menu system and then press the "F" key. Thanks to everyone who responded. Now if I could only get rid of my off the charts SWR I could get my first QSO!!!

Sorry for the late reply Paul, I have the Heil Proset Plus as well. I can only tel you the outside noise reduction is awesome. You can really pick out signals that you wouldn't normally hear. Now since I'm having major antenna SWR issues I can't tell you how the Mic is, but I expect it will outdo the one your used to!

From: Michael Hughey
Topic: 31437 Message: 31453

Keep turning the VFO/MEM knob until you see VOX show up above the "C" button. Press it to activate VOX. I had to go into the main menu to put my VOX sensitivity as low as possible because sometimes I accidentally turn it on. There are many, many menu sets to go through, so you may have to go through a few to find the one you want.

Hello Everyone,

I have a headset that has a y cable that plugs into the mic jack so I can use the headset mic on VOX. I followed the instructions in the manual, to go to Menu 40 and then momentarily press "F" key and use mem/vfo knob to select other options. Well for me, when I momentarily press the "F" key and use the vfo/mem knob, it just goes on to the next menu. It doesn't take me to where I can turn the VOX on. Any advice on what I'm doing wrong?

Thanks,

73,

Jethro

Vox is enabled/ disabled via the multifunction keys: A:B:C press F key <>1sec then turn MEM/VFO/CHAN until vox is over the "C" button. you can turn on or off VOX there.

hope this clears it up. Steve: AE5RU.

Jethro,

Do you want to turn on the DIGITAL VOX (for use in DIG mode only) or the SSB/AM/FM vox for use with the mike?

For the phone modes please look at page 28 in the manual.

Good luck

> I did and I get great audio reports. I didn't have any trouble with my hand mic, but I have gotten unsolicited comments on how good the audio sounds with the MD-100A8X. I looked at the Heil mics as well, after all, they are outstanding mics. But the Heil cost the same as the Yaesu, but I also needed to buy the mic stand and cable, bringing the cost out of what I could afford at the time.
>
> One thing to note with the MD-100A8X. You MUST turn the switch on the bottom of the mic in the bypass position. I worked for a month trying to get this mic to work with my 897, even contacting Yaesu for help. Then while looking at the paper that came with the mic, I saw a small note that I had missed when reading it for the first time. It states that the switch must be off for the FT-897 and a few other rigs. As soon as I put it in the bypass position, that mic came alive and I have been very happy with it since.

From: JJ
Topic: 31459 Message: 31459

Hello all,

I have a question about CAT operation. When you are using CAT do the radio front panel controls still function?

That is can I control the radio by the program and the front panel at the same time? Will the computer display track when I turn the front panel main tuning control?

I have been a ham for 46 years but no experience with CAT!

Thanks!

Yes, yes, and yes. The applications that I've used do not remove control via the radio yet are continually updated with any changes made via the front panel.

Hello Bret (and Rob, etc).
I bought 5 of the non-working Jabra headset adapters from a company on eBay that was selling known dead units. All of mine had dead batteries but other than that, they are working. I found the battery type off one of the dead batts. I think I found a very similar if not the same battery on eBay. Packaging is the key on the batteries right now. Most distributors don't publish the sizes so I ordered a few that looked about right. If these work out I may start a cottage industry reviving these things. Either way, once I find out about the fit and usability of the replacement batts, I'll post the info here. Basically, if this works I'll have 5 working units with new batteries that will have cost me about $10 each.

Once I get that far I'll look into making a few simple cables to adapt the cell connector to what we need for our radios and I'll let the world know, right here, if it all works out. :)

As for one with a manual PTT button, I really doubt you'll find a BT adapter that has that, but good luck.

As Rob mentioned in his write-up, there are 2 other BT adapters out there now. One looks like it might be the same as the Jabra in a slightly different package. Both I believe are made by Cardo who I never heard of before. There is a vendor on eBay claiming to have thousands of those. If they have thousands of them, might be something wrong with them. I have 5 that seem to be working so I have plenty, no need for more here. Should know more near the end of the week.

I use Ham Radio Deluxe (HRD) and you can use radio dials, buttons and Ham Radio Deluxe will stay in sync. I find some functions easier to engage via HRD as opposed to using the FT 897 buttons, menus, etc. It depends on the CAT based interface software you use.

Hi all

There shouldn't be too much of a problem implementing a remote ptt. In the B/T adaptor that I have (unknown maker) pressing the button on the headset causes a pulse on the mic line (or was it the phone line, I can't remember), and it is a simple thing to get a bit of cmos logic to toggle the pulse into a level that will drive a transistor for the ptt.

I have gotten my hands on a Diamond D-104. I replaced the stock mic element with a Heil HC-4 . I have been told it sounds a bit tinny. But, on pile ups, it has the oomph to push through just on the character of the sound. I also have the Yaesu MD 100 desk mic and that is the primary mic I use on 2/440 locally.

Either way, experimentation is always fun.

Paul, If you are looking for a headset/mic I have the Proset Plus, it has both the elements in it HC4 for DX and HC5 for regular rag chew. If you are looking for a mic only I have and would suggest the HM10. It also has both elements in it. My opinion is to get something that offers both the elements. They are not that much more as far as $$$ and than you have 2 mics in one. I also have and like the Travler Dual Side headset and mic combo.

I am looking to purchase an 897D for a Kids Radio Club. I need to know what year the 897 came out and what year the D version began production.

This is a major endeavor for a Kids group and we cant afford to waste our money. We can only get 1 HF Rig right now and so have a multiband/multimode would be the best economical decision when the price is right for Kids.

31473. 1Mhz step function and Clarifier/IF-Shift

Yahoo group: FT897 (2010)
Date: 2010-10-16 04:22:05 UTC
From: Rob Stampfli
Topic: 31473 Message: 31473

While chatting on my 897 tonight, I noticed that when I have the IF-Shift or Clarifier/RIT engaged, I can no longer use the 1 Mhz step function: Pressing the MEM/VFO knob has no effect until both the IF-Shift and Clarifier functions are cancelled. If the 1 Mhz step function is engaged, pressing the unmarked button to turn on either the Clarifier or IF-Shift immediately cancels it.

Does everyone's 897 work this way? Just curious: can anyone posit as to why Yaesu would implement it this way?

Thanks in advance,
Rob / KD8WK

I think the "HF" bands are all lumped into one for power control
purposes. The 897's power control is divided into what are essentially
four separate band segments, each with individualized power settings:
HF, 6m, 2m, 70cm.

YMMV,
Rob / KD8WK

31485. FT-897 shutting off

Yahoo group: FT897 (2010)
Date: 2010-10-17 15:36:39 UTC
From: bragucci
Topic: 31485 Message: 31485

My warranty is up in about 2 weeks. I recently noticed an issue and I'm not sure if I have a problem or not. I use an external antenna tuner, manual with a G5RV. When I tune up I have never lowered the power from the standard 100w. The unit will flash HSWR until I tweak the tuner and get it down. What is happening now is the radio is shutting itself off if the swr is around 3 and above. It has never shut itself off before. I assume this is a safety feature to protect the radio, but it's never shut off the radio before. You guys think I have a problem with the radio? Only thing that has me concerned is it has never shut off the radio before with high swr. I don't want to find a problem after the warranty expires. What you think??

Thx
Bart

Topic: 31485 Message: 31486

The radio will shut off due to prolonged high SWR.
You should never tune at 100 watts but reduce to 25 or 30w and switch to AM.
I started out using manual tuners but have since gone to automatic tuners such as the LDG made specifically for the 897; a lot quicker and worry free. Tunes G5RV and our other antennas without problems.

Subject: [FT897] FT-897 shutting off

My warranty is up in about 2 weeks. I recently noticed an issue and I'm not sure if I have a problem or not. I use an external antenna tuner, manual with a G5RV. When I tune up I have never lowered the power from the standard 100w. The unit will flash HSWR until I tweak the tuner and get it down. What is happening now is the radio is shutting itself off if the swr is around 3 and above. It has never shut itself off before. I assume this is a safety feature to protect the radio, but it's never shut off the radio before. You guys think I have a problem with the radio? Only thing that has me concerned is it has never shut off the radio before with high swr. I don't want to find a problem after the warranty expires. What you think??

Thx

31487. Unfamiliar with the signal meter on the rig

Yahoo group: FT897 (2010)
Date: 2010-10-18 13:03:21 UTC
From: Ian
Topic: 31487 Message: 31487

Hello,

I'm new to Amateur radio and only recently bought a FT897 and a tri-band vertical antenna (6m, 2m & 70cm). As yet I don't have a PSU that will allow me to transmit so I'm just listening for now. Before I had the antenna I just had a single wire out the back to see what I could hear. The answer was not much but plenty of noise (about 5 on the signal strength meter). Once I connected the new antenna I noticed that the meter no longer registered any noise (FM 2m). I used the built in scope feature and the 2m band seemed dead. I then tried my bit of wire and up came the noise and I had bars showing on the scope. I assumed there must be a problem with the antenna so at the weekend I took it all down but the cabling seemed fine so I took off the coaxial plug at the rig end and placed just the central core into the radio. I then got plenty of noise on the meter. As soon as I connected the coax screen to the rig the noise disappeared. Not knowing if this was correct I replaced the plug. The next day I went through the bands and picked up some international stations on HF and some more local ones on 2m. I guess this means that the antenna is ok? Is this correct to have no noise showing on the meter ? The meter does show readings when I get a proper signal. When I used a CB radio 20 or so years ago, I'm sure I would get meter readings with the noise.

Bart,

When the HSWR flashes it should reduce power. I am sure you are not doing your radio any favours.

However on a different thought, knowing nothing of your tuner, but why don't you make a list (spreadsheet?) of the different settings of your tuner for the different bands? Keep it by your tuner. That way if you change band you can adjust your tuner before you transmit and only have fine tuning to do. I'm sure your tx will thank you in the end.

I would also suggest you connect your transmitter output to a dummy load/power meter and check you are still getting the power you expect. That way you maybe able to get a problem resolved under warranty as if, as you say, the radio didn't shutdown and now it does, something has changed and it is likely to be in the high power part of the transmitter.

From: g8hul
Topic: 31485 Message: 31489

Some food for thought; the suggestion is to reduce power before you start to tune when the VSWR is high; how does the radio reduce power? It uses exactly the same mechanism as the High VSWR protection uses to reduce the power. So once the power is reuced there is no difference between manually reducing the power and lettingthe VSWR protection circuit do it. But what about the inital state before the VSWR protection operates I hear you cry, well, it is well documented that the FT897 takes a while to reduce its power anyway, causing an initial overshoot regardless of the power that is set manually.

So there is probablly very little, or no, difference between letting the VSWR protection do the work and manually reducing power, and certainly once the power is wound back there is NO difference.

My first thought is a high amount of RF in your shack. Could be why the radio is shutting itself off.

Like the other guys said, try tuning at a lower power level and see if it fixes the problem. After you're tuned, run the power up full and see if the radio still shuts off.

From: Robert Tuck
Topic: 31487 Message: 31491

The FT-89D uses two antenna connections one is for 2m/70cm and the other is for HF/6m. Using any antenna or piece of wire for that matter you should be able to receive strong stations. The proper antenna makes that reception much stronger.

Wer you trying to receive 6m/HF signals with the antenna connected to the 2m/70cm connection?

Or were you trying to receive 2m/70cm with the antenna connected to the HF/6m connection?

With these combinations, you would only hear VERY strong starions and very little noise.

The HF/6m connector is the one closest to the power connector.

Robert

When you connect the center connector of a PL-259 to a radio and leave
the ring disconnected, you are in essence using the feedline (and antenna)
as a longwire against ground. If you hear a lot more QRN and signals in
this configuration than with the connector fully mated, it usually means
that there is either a fault in the antenna or feedline -- a short or
open circuit -- or the antenna is designed for a widely different band
than the one it is being used on. Check the antenna with an ohmmeter
to determine if it is shorted when it shouldn't be or vice versa. If
this doesn't detect any problems, your next step is usually to transmit
and see if there is a (very) high SWR, although admittedly, you may not
be able to do that with your current setup.

It looks like you diagnosed your problem as a bad PL-259 and resolved it.
Soldering 259s is an art: If you apply too much heat, you can melt the
interior insulation.

I once had a balun which had shorted internally, which was difficult to
detect because a balun should appear shorted in an ohmmeter check. The
only way to diagnose that one was through the process of elimination,
and the proof involved cutting the balun open with a hacksaw. That's
another reason why I prefer simple antennas.

YMMV. Good luck,
Rob / KD8WK

Hi Ian,

yes, the symptoms you are seeing can be correct.

With the short wire and with the centre only of the antenna coax connected,
you are picking up local noise near the radio but when you have the coax
correctly connected, the pickup of local noise is much reduced as the centre
is screened out to the end of the coax where the real antenna starts.

The noise being picked up is probably from a switchmode power supply or other
piece of equipment in the room where the radio is, possibly the PSU you are
running the radio on.

On AM and SSB mode, there should some low level static in the absence of signals, possibly not enough to move the S meter. At night, you should pick up plenty of signals and static on the 40 and 80 meter bands, even with a short wire antenna. Many of the shortwave broadcast signals on the 40 meter band should peg the meter all the way!
Other good place to look at the standard time frequencies at 5, 10, 15 and 20 mHz.

Hello,

I've just bought a PSU for my FT897. I want to check the SWR of my antenna using the inbuilt SWR meter. As I am new to Amateur radio I don't want to upset anyone with my test transitions. How should I go about doing this? I guess I should keep the power as low as possible, listen so see if anyone is using the frequency. When I key the mic, should I give my call sign or say I'm testing etc?

Ian,

If you SQL is set properly on the 2 meter FM, you will have no noise level indicated on the meter until someone actually is transmitting on the frequency.

Andy,

For the PSK, make sure your are in USB for your mode and not DIG when using a soundcard. Also make sure your Mic Processor is not on. The PC will not modulate the transceiver if the Processor is on. I learned this from experience.

The 5 mhz channels are in the memories. The 5 mhz band is channelized.
Some regs are different from other bands also.
You do not need to open it up.

31503. 60m operation control

Yahoo group: FT897 (2010)
Date: 2010-10-20 01:23:41 UTC
From: Rob Stampfli
Topic: 31496 Message: 31503

Just curious: I understand the FCC is considering several changes to the 60m band, including (1) adding additional channels, (2) moving one channel, and (3) allowing additional modes of operation. If this comes to pass, does anyone know if Yaesu has an upgrade path which would allow us existing 897D owners to keep current and take advantage of these changes?

BTW, here's a 60m tip to you 897 owners who also have an LDG AT-897Plus tuner: The 897 only allows USB mode to be selected on the 60m memory channels, so the tuner, which uses the CAT interface to put the 897 in AM mode for the tune cycle, will not tune on the 60m channels without some help. On a lark, I took a deep breath one day, hit the Tune button on the LDG, and blew a long whistle into the mic, and it worked. If you run out of breath before the LDG is finished tuning -- which is quite possible -- the tuner will even pause momentarily while you inhale, and pick up where it left off as soon as you re-commence whistling into the mic. Just remember to set your PO down to 50W before you do this. (And, no, I don't want to get into a debate over the legality of using this technique. I'll leave it up to each individual to determine if this constitutes proper USB operation on 60m, but I can attest it does work for me.)

You will have to do what the rest of the world has to do where the 5MHz channels do not line up with the pre-programmed US ones (which are not accesable on non-US models any way) and that is do the wide band mod.

By the way the OP was a UK station where you have to do the mod to get 5MHz Tx. Also there are no mode restructions in the UK.

Hi there!

It took me a long time to find out what is the meaning of that running man in FT-897 display. However I still have not found any explanation in the manual. Is there any explanation there at all or is it just that you have to find out it in other ways? Very strange indeed.

Ben

Hi Ben:

In my FT-897D manual it is covered in "Front Panel Controls & Switches" section in the "Power Switch" subsection. It is also covered in more detail in the "Operation" section under "Changing the Dial Speed".

Hope this helps.

Ben-
Sure, the "Running Man" explanation is in the manual. On about page 12 in the manual, in the description of "(5) POWER Switch. It's all there.

In HF & VHF/UHF the rate is 10Hz for slow (stop man) and 100Hz for fast (running man) when you use DIAL in SSB&DIG

For SELECT tuning it's 1Khz (slow) or 2Khz (fast) for 1Khz step select for SSB

Make sure to use AM or FM mode for your tests, otherwise, you won't generate a carrier. Then, switch back to SSB to identify.

If you have the resources, you would be better off with an antenna analyzer like the MFJ-269 or equivalent. You don't have to identify with those, HI.

Go to the mods.dk Web site and download the instructions from there on "widebanding" your radio. I did this in order to get my 897D to work on our local state government channels (legally).

31514. Re: [FT897] Unfamiliar with the signal meter on the rig

Yahoo group: FT897 (2010)
Date: 2010-10-20 09:38:23 UTC
From: ROBERT FAREY
Topic: 31487 Message: 31514

Hi As an instructor i have noticed the clubs carrying out the courses on amateur radio, are very wanting.
Here in the united kingdom this is usually done in radio club.where a certain fact has to be pointed out in the beginning of the instruction to those who in the past have used C.B. equipment.
Amateur radio is a different league. If you think it is anything remotely like CB you are in for a few shocks.
We generally help one another unless you start trying telling us you know it all. then we clam up and let you make mistakes, like burn radio output stages out because you will not listen to advice that is human nature.
Amateur radio can be the best thing ever but be a listener first of all, you will loads of rubbish and some wisdom and it takes a while to know the difference.
If it sound stupid it probably is. we have people who say they know it all, no they don't they are the idiots, this hobby is so diverse and complex and is also full of some idiots.
The signal meter on a rig can be just a guide and should never be taken as the absolute truth.
with a screwdriver you can make it read just what you like, the S meter being a good example.
the modern idea of putting a vswr meter integral with the radio is going to cause a lot of pain and tears.
even some external ones if cheap like the old CB ones will be no better.
Power supplies, this does cause a lot of issues, sorry but the cheap switch mode may be fine for FM as it is a constant power source and drain.
but listen to one with AM and you will hear it's frequency change the more power is taken.
many a problem as well as injecting noise into the radio. i know a lot don't agree with me but it has to be either a linear or a good old fashioned car battery for me for a noise free power source.
one very other essential item is either a ATU or a AATU what ever rocks your boat unless you get good at cutting antenna's to resonant at the correct length.
Modern transcievers don't cope with poor vswr, they either shut down or burn out the final transistors.
So the choice is yours buying the radio was one expense but being able to operate it takes extra equipment which you will need to purchase or adapt other ways.

Regards Robert G6LLP

Ian,

If you SQL is set properly on the 2 meter FM, you will have no noise level

indicated on the meter until someone actually is transmitting on the frequency.

Subject: [FT897] Unfamiliar with the signal meter on the rig

Hello,

I'm new to Amateur radio and only recently bought a FT897 and a tri-band vertical antenna (6m, 2m & 70cm). As yet I don't have a PSU that will allow me to transmit so I'm just listening for now. Before I had the antenna I just had a single wire out the back to see what I could hear. The answer was not much but plenty of noise (about 5 on the signal strength meter). Once I connected the new antenna I noticed that the meter no longer registered any noise (FM 2m). I used the built in scope feature and the 2m band seemed dead. I then tried my bit of wire and up came the noise and I had bars showing on the scope. I assumed there must be a problem with the antenna so at the weekend I took it all down but the cabling seemed fine so I took off the coaxial plug at the rig end and placed just the central core into the radio. I then got plenty of noise on the meter. As soon as I connected the coax screen to the rig the noise disappeared. Not knowing if this was correct I replaced the plug. The next day I went through the bands and picked up some international stations on HF and some more local ones on 2m. I guess this means that the antenna is ok? Is this correct to have no noise showing on the meter ? The meter does show readings when I get a proper signal. When I used a CB radio 20 or so years ago, I'm sure I would get meter readings with the noise.

Hi Ian
The built in swr meter is meant as a guide and is not to be taken literatrally. purchase a dedicated one for the bands you are going to use.
in most cases up to 150mhz one will do. The old c.b. ones are generally useless.
you also need a dummy load so when taking measurements you have a standard to work to. it should be rated larger than the power you will get from the radio.
when you have established that the radio is putting out its full power usually done on FM mode because whistling up a carrier tends to be inaccurate.
check the audio out usually best on a vhf call to either a simplex channel such as 145.500.mhz.
after having checked that the aerial is at a vswr of less than 3:1.
the return loss which is what the vswr is will be a factor in how much power one is transmitting.
when testing this ft897 on the HF bands an additional ATU would be a good idea unless you know how to cut a antenna to the correct length.
Tuning up of the radio up on a frequency is the next thing to do, using an ATU, using low power you may need to make several adjustments, so listen first to make sure no one is using the frequency.
Listening and asking if the frequency you have chosen is clear is good manners and should always used.
when you recieve no reply after a couple of minutes , that would indicate a clear frequency.
i would suggest to try the the vswr on the antenna with the ATU set up use low power and make a CQ CALL and it needs to be a long call not a 5 second wonder as this is the usual mistake a 15 -20 secs call should produce some reply but if this fails remember some one has to hear you and adjust themselves to your frequecy and then call you back so it could take several fruitless calls and about 5-10 minutes before you get a reply.
take it slow to start with as it will cause you to get tongue tied, if it doesn't it will at some stage. several overs maybe required to establish the callsign of the othere station.
GOOD DXing Regards Robert G6LLP

Andy,

For the PSK, make sure your are in USB for your mode and not DIG when using a soundcard. Also make sure your Mic Processor is not on. The PC will not modulate the transceiver if the Processor is on. I learned this from experience.

Hello I have just got a new FT-897D.

I would like to open it to 5mhz. what is the recommended way?

Also I have made a CAT interface and data interface for HRD and PSK etc. I have found all works ok but the PC will not make the radio TX. am I missing somthing?

Thanks Andy

[Non-text portions of this message have been removed]

Andy:

If your FT897d is like mine, the 60 meter channels are already in the memory bank. Hit the V/M button on the upper right, and there they are.
if you' ve entered any thing into memory, that will come up first, but if you hunt around a bit (use the mem/vfo knob) you will find them. See page
23 in the operator manual.

The "running man" is the indicator for fast tuning. It it activated/deactivated by momentarily pressing the power on key. Just press it again to deactivate it.

There is no blue button on the FT 857 and apparently Yaesu left the color of the POWER ON button to NOT be blue. Momentarily pressing the POWER button to activate/deactivate FAST TUNING.

I have the Yaesu ATAS 120 screwdriver for HF and the Comet CSB 790A dual band. Both are mounted on K400 gutter lip mounts on the top edge of both back doors on my S-10 pickup. The ATAS does an ok job, it won't tune everywhere. Neither will the FC-30 automatic tuner. I ended up going back to an MFJ 986 tuner for my wires at home. I wish I'd done more research on the HF or I would have gotten a Hi Q HyGain screwdriver.

The "running man" simply means the 897, is in the "jog" mode, for a faster
PTO tuning step.

31529. AM does not respond to CAT PTT

Yahoo group: FT897 (2010)
Date: 2010-10-22 13:44:07 UTC
From: ridge_bo
Topic: 31529 Message: 31529

Hi everybody,

I fail to get my FT897D to be keyed in AM mode when using my PC. The PTT and modulation is working in SSB or any other mode, except AM. No modulation and no PTT. I am using a homebrew serial interface for keying the rig for years (btw: AM works perfectly using the mike.)
Now I'm starting to wonder if it is at all possible in AM...? I would have liked to replay on-the-fly recorded modulation tests during my AM ragchew evenings.

Many thanks in advance,
Bo rs1ri

From: diveone
Topic: 31533 Message: 31533

I was listening to twenty meters last night, and keying up to respond to a "CQ", when the rig seemed to reset all by itself. All my memories are gone along with custom settings (like display colors etc.)I was running the rig manually - no computer control.

I got back on and tuned to the CQ and was able to transmit OK.

Does anyone know if this is a common occurrence with the FT-897D?

Thanks in advance for any help/comments.

Do you have your CAT cable plugged into radio and not the computer? I had this happen when the USB connector touched something on my desk and the possible shorting of the plug caused my radio to reset.

Just a thought...,

If you have the MH-31 microphone, push the FST button and the running man will go away and you can tune slower. Push it again and he'll come back for faster tuning.

> If you mean to use the 897 as a cross-band repeater, the short answer is
No.

Longer reply: You need two receivers, either one capable of receiving whilst
the other side is is transmitting and either two transmitters or a
transmitter capable of switching band on squelch control.

If you are thinking of using just ordinary split band working, like
satellite working, just use the twin VFO's.

Unfortunately there is no easy way of achievimg what you are after with those radios.

The 8800 does not have any remote control facilities. However, if the 8800 is the same as the FT8900 it will remain in talk through mode when the power is supply is removed, and come back in the same state when power is re-applied. So if you can find a way of switching the PSU on and off remotely you can switch your t/t station on and off remotely.

Unless you have the optional mic with the 897 you do not have any way of remote control, such as DTMF tones, so you will need a new mic or an external DTMF generator.

Of course if you have the facilities there might be other ways of controlling the 8800, again if it is like the 8900 it would be possible to emulate the remote microphone from a pic type controller, or perhaps emulate the data that goes down the seperation cable for the front panel, but both of those solutions would require a lot of work!!!

Hi guys
i wondered when this topic would crop up as there have been issues with FT8900 used in the rebro way some cross band frequencies simply do not work with the FT8900 and i wonder why try to do this a pair of old storno's do a far better job and they are designed for this and they cost far less than using a radio which at best has a less chance of survivng as it's duty cycle is not meant to be used in a continuos mode unlike the storno's.
which where designed for this sort of operation. regards Robert G6LLP

First thing, do you have a dtmf mic for the 897? but the simple way is use of DCS for encode/decode of the (of the 8800) input from the 897. And vice versa.

Yo do know you can run crossband from the 2M side as well?

Having re-read your post perhaps I was answering the wrong question! I assumed that you wished to remotely control the Ft8800, rather than just run a Raynet control station from your home QTH with teh FT897.

I am not sure why you wish to operate split frequency, as 'normal' Raynet procedue is to have the control station working on UHF only through the t/t, which then talks to the the out-stations on VHF. That way you only need to have a receiver on one band at a time.

I suspect it would depend on the band. (FWIW, I've heard the 897 is fairly economical at lower power levels, compared with other rigs, though.)

Barry,

Thank you for your suggestion. I noticed one other "symptom" that I forgot to mention in my first posting. I also noticed a "beeping" sound as I keyed my microphone, which I later realized was the 897 switching from "fine" tuning (no running man) to "fast" tuning (running man icon). It would switch back and forth while I talked with the microphone keyed on HF (not on VHF).

Having said all that.. I unplugged my cable from the rear of the rig and now I am NOT noticing the switching back and forth from "fine" to "fast" as noted above. I have my fingers crossed that the rig does not reset on its own.

Will keep you posted and thank you again.

The same thing happened to me with my FT-857.
That was caused by a big RFI generated from the antenna.
I connected an air-choke after the antenna and the problem is solved.
Verify your RFI.

I just purchased my FT-897D and have discovered an issue I can't find the answer to in the manual. I have the Yaesu software to program the radio which works well to build memory channels. However, if I unplug the interface cable from the computer, the radio seems to lose the PL tones programmed into it. It will not open the repeaters on any channel. If I plug the USB cable back in to the computer, the memory channels all work properly. What am I doing wrong?

From: va3rcs
Topic: 31552 Message: 31552

Hi Group,

I have been using my FT897 "D" for about 5 years now with no issues or troubles what so ever...

Recently I have had reports of my Transmissions breaking up on VHF/UHF (I no longer use the radio for hf as I bought a FT847 18 months ago)

The problem is that the radio starts to cut out on TX. Its almost like I was dropping the PTT switch for a 1/2 second or so.

I have swapped out the mic, thinking it was a problem with the cord or the head and the problem remains.

I have tried switching antennas and feedlines thinking it could be a blowing in the wind issue and the problem remains.

Using the built in SWR Meter there is no indication of the carrier dropping and using the built in power meter there is no indication of the carrier dropping.

Everything looks normal at my end, but stations on repeaters and on simplex tell me that suddenly it blinks out and blinks back. This includes stations very close (less than 1km away) or stations in the distance.

I can't tell if this is happening on 2m ssb as no one is around with the proper equipment when I ask...

I hate to send it in to Yaesu and tell them to find the problem, then fix the problem because the unit is off warantie and it might be cheaper to buy a new radio... But I also don't want to replace the radio if its a simple fix...

Anyone out there with any suggestions on what the problem could be???

Hi Ken
           although usb is supposed to be hot plug, the radio could be objecting to this idea.
try turning off both radio and then computer before withdrawing the connecting cable.
if this has not been tried try it.
these things have there own little problems with such issues.   Regards Robert G6LLP

Hi
the use of vertical antennas gives all sorts of RF issues in the Shack that is why so many use a horizontal dipole or doublet with an ATU the balanced antenna system gives none of these issues.
the other topic that takes some getting used to understanding is the power source issues. a large car battery will give better voltage stability than some mains driven power supplies.
it is a question of capacity although the radio's are rated at 22 amps max on full power they do draw more power when the first keyed up it's due to the amplifier ramping up. failure to understand this issues results in allsorts of issues like vco going off frequency inside the radio. Regards

Hi
   Being a raynet controller, with a lot of new boys has it's problems as they have a limited knowledge base about issues with a host of issues.
the most obvious is understanding that amateur radio sets are not as robust as we would like with regards to power output over a sustained period.
when you use an amateur radio for contests or just chatting the period it is operation is short on transmit. that is when the radio output stage gets hot. and it may get very hot in certain circumstances.
some use an external fan to cool things down, because if you don't the output transistors overheat and do burn out.
so when looking at items like amateur repeaters and re bro units it is best to think in terms of the commercial markets units designed to work 24 /7 as they have been designed for that sort of operation. Regards Robert G6LLP

Do you have a name?

First the change in frequency when you key the mike. Is the other frequency that comes up on the other VFO? If it is it sounds like you are in split mode.

Buddipole comes with a leaflet that tells you how to set up and the dimensions to tune the aerial. If you carry them out properly then you should not have a high swr. A Buddipole is only a dipole and like all dipoles, correctly tuned for the frequency you wish to operate on, should be a low SWR aerial.

I suggest you set your rig to 5 watts, sort out your tx/rx frequencies and make sure you have a correctly tuned buddipole. Don't forget to make sure you have a clear frequency whilst testing and identify yourself. Finally when you are confident everything is working try a couple of low power QSOs in your chosen mode on your chosen band. With a buddipole you will have to adjust it each time you change bands and possibly if you move up and down a band you have previously tuned for.

Personally I have never had a problem that has been cured by grounding my rig. I have found using a choke, at the aerial end (google search choke balun) prevents RF feeding back to the rig and I do use an AT897 atu to save having to continually retune the aerial.

Good luck.

>

Spurious Rf can cause all kinds of problems, especially with swr. Grounding, as I'm sure you all ready know because you're an amateur, is very basic and also very important. Ground your whole system (but not in series) and you will eliminate many potential problems. Also ferrite coils added to a feed line can reduce stray RF.
The separate receive/xmit can be caused by having, split selected in your menu. Take a look at your manual and it will explain all the selections that can be made.
If your manual is not handy go to Yaesu.com and download a pdf copy of it.
You have an excellent radio, but it is quite complex and has many great operation guidelines.

The problem with the Buddipole on 40m is that it is too close to the ground. The SWR will be high as the feed impedance is substantially below 50 ohms on that band. The addition of a ground may be changing the feed impedance via transformation through the coax or some other odd method. Either use a tuner (I use the LDG Z-100Pro), or buy Buddipole's switchable transformer designed for this purpose.

As for the change in frequency, I'm assuming you've hit the "Split" button which is causing you to transmit on a different frequency than your receive. For that, I will refer you back to your owner's manual. If you can't decipher the instructions in the manual, come on back and ask for more help.

Check your deviation on FM. If the mike gain is too high and you are severly over deviating, repeaters and other FM receivers could be cutting off your audio.

We had a similar problem with Daniels Electronics repeaters used on fires in narrowband mode. Wideband radio would sometimes cause the repeater to "shut down" for several seconds at a time. Since this can be a real problem on fires, wideband radio use is banned with these repeaters.

Sounds like your operating in the "Split" mode, with VFO A and VFO B being
active to produce the Split.

Press the "FUNC" button momentarily and then rotate the Select knob until
the VFO menu appears. Press "Split" and the you should now be back in a
none split mode.

31568. DSP Toggle problem

Yahoo group: FT897 (2010)
Date: 2010-10-27 23:41:31 UTC
From: Pronto. (Military)
Topic: 31568 Message: 31568

I have an original 897 (non D) and in the early days there was comment on a mod to enable the DSP to toggle back to original menue.
Now I know that Yaesu had a firmware fix but there was a mod to add a wire somewhere. Does anyone remember how that was done?

> Hi there just starting out in the ham world I have two problems the first problem is that I had high swr until I grounded the transceiver is swr affected by transceiver grounding I am using a buddipole the second relates to the transceiver lets say I selected 7100 and I key the mike to transmit when the mike is keyed another frequency comes up completely different to the frequency selected has this got something to do with the dual vfo I must have pressed the wrong button if so and how do I go about undoing this as I cannot transmit on the selected frequency know
>

Spurious Rf can cause all kinds of problems, especially with swr. Grounding, as I'm sure you all ready know because you're an amateur, is very basic and also very important. Ground your whole system (but not in series) and you will eliminate many potential problems. Also ferrite coils added to a feed line can reduce stray RF.
The separate receive/xmit can be caused by having, split selected in your menu. Take a look at your manual and it will explain all the selections that can be made.
If your manual is not handy go to Yaesu.com and download a pdf copy of it.
You have an excellent radio, but it is quite complex and has many great operation guidelines.
73, Bill k3waw

31570. What part of the 2m band to use my FT897 on?

Yahoo group: FT897 (2010)
Date: 2010-10-28 08:28:59 UTC
From: Ian
Topic: 31570 Message: 31570

I know this is slightly off topic as it isn't FT897 specific but it is the rig I will be using. I'm new to Amateur radio and need some advice on how to start. I'm going to start on 2m (in the UK). I've been looking at the band plans and see that there is a calling frequency at 144.050MHz. Should I be calling CQ on this frequency? I've noticed a lot of activity around the 145MHz and above. I'm looking to use FM so can I call CQ on these upper FM Simplex frequencies or on a repeater frequency?

Ian 2E0ZQR

Ian

There are plenty of info on band plans on the net.
In UK, look here for general band plans
http://hflink.com/bandplans/UK_bandplan.pdf

here:
http://www.rsgb.org/spectrumforum/bandplans/

here:
http://www.pcsystems-ss.co.uk/g7lrrweb/index.php?module=pagemaster&PAGE_user_op=view_page&PAGE_id=34&MMN_position=55:55
(along the bottom click on the 2m link)

Good luck
Jerry

Ian, you need to read the band plans more carefully.

Pay particular attention to the modes that apply to each area of the band.

144.050 is the CW (morse) calling frequency and you will not make any friends by transmitting FM voice there!!!

145.500 is the FM calling frequency and 144.300 for ssb (USB).

Also pay attention to the notes regarding the use of particular spot frequencies for particular applications, you can very easisly upset people by using them from the wrong thing. Try to keep the Emergency comms (Raynet) frequencies clear, and watch out for things like SSTV calling frequencies.

Whilst the band plans are not complusory, not abiding by them can make you very unpopular!!

There are several frequencies on the two meter band.

The one that you identified 144.050MHz is the CW calling frequency. Use of FM there would not be appreciated!

144.300MHz is the SSB calling frequency, again, use of FM is not a good idea!

With exceptions FM should be restricted to the channelised frequencies between 145.000MHz and 145.800MHz. The calling channel is S20, 145.500MHz

There are several other calling frequencies which you will find in the RSGB's band plan which you will find at <http://www.rsgb-spectrumforum.org.uk/bandplan.htm>.

Use of these is not mandatory, but to prevent the two metre band deteriorating like the HF bands, observance of the band plans is seriously advised.

Thanks for all your advice. I certainly don't want to upset anyone or transmit on the incorrect frequencies. That is why I posted here for some advice before transmitting. Looks like I got the term "Telegraphy" confused with "voice". Thanks again for all your assistance and links. I think I'll do some more listening before transmitting.

HI IAN,
I see you have received the information on 145.500 as the FM
calling frequency
and 144.300 on SSB also 433.500 is the 70cms calling freq.

also if you want to use a 2m repeater and if it needs CTCSS to open it ,
you will
need to find out what ctcss your local repeater requires , when you know
select it in your
your menu on the 897. read the manual on that ..
if your repeater needs a tone burst to open it press the HOME button
what i did on my 897D was to save into memory a few favorite repeater freqs
on 2m and 70cms so i could go to them quickly., read the manual how to do
this
plus by saving a repeater into memory you also save the ctcss which saves
you having to
select the T each time in you want to use a repeater

hope you were able to follow my thinking.

31576. Microphone Pinout

Yahoo group: FT897 (2010)
Date: 2010-10-28 18:14:55 UTC
From: scotchmandr
Topic: 31576 Message: 31576

I was given a so-called "Corrected Pinout" for the Microphone connector for the 817. It contained the center three pins for 5+, Mic, and Mic GND in a reversed order. When I looked at the minuscule 897 diagram and it is flipped with the clip on bottom, It appears to be the exact plug as the one listed in the 817 manual just upside-down.

So before I mess anything up. The 817 and 897 share the same Mic pinout correct? Can they share the same mics like the MD100? And is my so-called "Corrected" pinout posted on some site right or wrong? I am going to assume that the manual is correct unless there is an errata I don't know about?

I got an MD-100 and wondered if it could serve as a computer mic for echolink and also with my 817?

Phillip

Don't know why you would need a corrected pinout. The ones in the manual
are correct.
They are shown looking into the mike jack on the radio.
Some get mixed up on looking into the reverse side or the end of the cable.
You just have to think about it and use some common sense logic.
Some one should do there own research and not depend on some one else.
The first ones to offer help are some times wrong.

Hi Stephen
The speech processor idea's in a lot of cases leads to over driving the transmitter. and over modulation, this may very well be why the peak envelope power is showing just 70%. as you are losing some power in the over deviation.
it is a subject which can be very misleading.
As you give no indication of your expertise in the field it would be correct given the evidence you have given you have little knowledge of the subject of amateur radio and how to operate.
I have held a licence since 1981 and although i have years of exprience i find that using this speech compression is an over the top issue.
it is just not needed to make a successful QSO. and can lead to all sorts of problems with RFI as well as some mistakes with output readings.
use the radio on full power into a dummy load and also switch to fm mode that will tell you if this radio is transmitting it's full output.
whilst on the subject of transmission you should just use as much power as is needed to make the the QSO that means usingh the least and not over modulation with as much processing of the voice as possible that is poor operating and considerd by most amateur as an aligator.
learn to use just enough power to make the contact in the true spirit of amateur radfio. every call does not need to be 599, that is not the spirit of the Hobby.

Regards Robert G6LLP

>

Hi Stephen

First a few points to clear up:

Mic Gain and Speech Processing settings are not the way to set the power on the FT897.

The power can be set for HF, VHF & UHF independantly.
Hold the F buttton for a second or so to access the Menus, then select number 075 to set the power on the current band.

It is useful to assignthis function to a soft key, then you do not have to go into the menu structure. See page 51.

The mic gain should be set to a level that suits the mic in use and your voice, and how far you speak from the mic. 100 is most likely too high unless you talk a long way from the mic ot it is very insensitive. Unfortunately the ALC indication on the 897 is no a reliable way of setting the mic gain, as it seems to vary widely from radio to radio as to what the number of blocks actually mean.

On my radio for example if I set it as per the book with one or 2 sehments showing the peak output is below 50W. So you really need a peak reading power meter, or compare the envelope on a scope with a 100W cw signal.

Regarding the power meter reading, make sure that it is in peak reading mode and that you have the external dc power connected otherwise it will not read peak, just average and the readings will be low.

Try a long whistle, this should give you the same reading regardless of mode. Remember that ssb only gives an output when you arecttually speaking.

The speech processor settings should be much less than 100, try in the 20-50 range and get reports from another station as to which is the best setting. Don't forget that the processor must be switched on & off via a soft key, (row c - PROC)

Hope this helps.

73
Jeff

Hi there Robert thankyou for coming back to me yes Im only just starting out and have read and heard people talking about using minimum power to make the QSO and do understand that is what it is all about in the true spirit of amateur. Im just confused that when I tried reading my pep last night when I had set 100 watts that it was reading only 70 percent, does that mean that I shoud be removing some or all of the speach compression you talk of it causing some mistakes with output readings its a new radio there is no damage to the transmitter is there? I hear you on testing into a dummy load and testing it on FM, when you talk of RFI do you mean RFI coming back from the antenna or is it the RFI going out from the transmitter through the meter as I have an rf choke on the antenna feedline at the antenna. I hear you on the use of the speech compression with regard to it being an over the top issue and that it is not needed to make a succesful QSO.I want to learn and am only going to learn from people like yourself and have no access to a club where I live as I live in outback Australia.
I will get myself a dummy load as ive not got one and will have to order myself one by post. I understand the basics of over driving and over modulation. Another question from me if I were reducing my power and speach compression say to 50 watts lets say would the meter then be reading a true reading possibally. When you talk of over deviation what does that mean and why am I losing that power. The maual talks of ALC and has to say that if it is reading to high or low that you will have reset the microphone gain how much should the meter read when talking into the microphone the manual says a couple of bars does that mean two or are we talking about more as I notcied that it was reading above five when transmitting could this be an indicaction of of over driving and ovemodulation Thanks again for your advice and help Regards Stephen.

Hi Stephen
the problem may best be sorted by doing a hard reset, go back to factory settings.
take this one step at a time.
check the power output on FM using a external SWR Bridge and dummy load.

you will need either a ATU to tune an antenna to the radio or an Automatic antenna tunning unit.
The alc is set up to drive an automatic antenna unit. it actually drives this device.
The alc setting is not needed to be set up for a manual antenna unit as you will make the adjustments.
The reason to go back to factory defaults is because it makes it easier to setup the whole system if you start from the beginning.
so please e-mail me at robert.farey@...
and then we can converse via e-mails, Regards Robert G6LLP

Hi there Robert thankyou for coming back to me yes Im only just starting out and have read and heard people talking about using minimum power to make the QSO and do understand that is what it is all about in the true spirit of amateur. Im just confused that when I tried reading my pep last night when I had set 100 watts that it was reading only 70 percent, does that mean that I shoud be removing some or all of the speach compression you talk of it causing some mistakes with output readings its a new radio there is no damage to the transmitter is there? I hear you on testing into a dummy load and testing it on FM, when you talk of RFI do you mean RFI coming back from the antenna or is it the RFI going out from the transmitter through the meter as I have an rf choke on the antenna feedline at the antenna. I hear you on the use of the speech compression with regard to it being an over the top issue and that it is not needed to make a succesful QSO.I want to
learn and am only going to learn from people like yourself and have no access to a club where I live as I live in outback Australia.
I will get myself a dummy load as ive not got one and will have to order myself one by post. I understand the basics of over driving and over modulation. Another question from me if I were reducing my power and speach compression say to 50 watts lets say would the meter then be reading a true reading possibally. When you talk of over deviation what does that mean and why am I losing that power. The maual talks of ALC and has to say that if it is reading to high or low that you will have reset the microphone gain how much should the meter read when talking into the microphone the manual says a couple of bars does that mean two or are we talking about more as I notcied that it was reading above five when transmitting could this be an indicaction of of over driving and ovemodulation Thanks again for your advice and help Regards Stephen.

Subject: Re: [FT897] FT897D power output

Hi Stephen

The speech processor idea's in a lot of cases leads to over driving the transmitter. and over modulation, this may very well be why the peak envelope power is showing just 70%.

as you are losing some power in the over deviation.

it is a subject which can be very misleading.

As you give no indication of your expertise in the field it would be correct given the evidence you have given you have little knowledge of the subject of amateur radio and how to operate.

I have held a licence since 1981 and although i have years of exprience i find that using this speech compression is an over the top issue.

it is just not needed to make a successful QSO. and can lead to all sorts of problems with RFI as well as some mistakes with output readings.

use the radio on full power into a dummy load and also switch to fm mode that will tell you if this radio is transmitting it's full output.

whilst on the subject of transmission you should just use as much power as is needed to make the the QSO that means usingh the least and not over modulation with as much processing of the voice as possible that is poor operating and considerd by most amateur as an aligator.

learn to use just enough power to make the contact in the true spirit of amateur radfio.

every call does not need to be 599, that is not the spirit of the Hobby.

Regards Robert G6LLP

Hi there a bit confused about the output power settings on the 897d have followed the instructions on page 30 of the manual regarding the ALC and have set Menu mode No 81 the ssb mic gain to one hundred assuming know that Im putting out one hundred watts know, and also adjusted the AF Speech Processor setting to one hundred, when transmitting the PEP power reading on the crossneedle swr/watt meter only reads seven on the left hand scale which says forward the meter is a Daiwa CN-801 series HP does this mean that im only putting out seventy watts or am I not reading the meter correctally or am I not doing

something right in the setup again 73s Stephen.

Actually that info is incorrect by my records. Here in Ohio we show the national calling freq on 2m SSB as 144.200. The FM calling freq is 146.52. There is a CW, EME, Meteor and other calling freqs listed here:
http://www.k0nr.com/rwitte/2m_frequencies.html

and here:
http://www.ac6v.com/callfreq.htm

And all it took was a Google search on "2m us band plan".

Now I did assume this was in the US... It in fact will be different in other areas but substitute any other country in the Google search for "us" and you should find listings for those countries as well.

It always helps when the call is included and I forgot to look for it in the original question. If however you want to cross borders, best to look at the band plans for both countries and find overlapping freqs if possible.

Is it just me, or does that make no sense whatsoever?????

What has the ALC got to do with an ATU?

Of course an ATU is not required at all if the antenna is a dipole cut for the band in question, or some other antenna that is close to 50 ohms.

I wouldn't worry about adding ferrites to the Buddipole assembly. I believe the feedline that comes with it already has a "choke balun" on it. It will be on the end with the connector pins that plug into the antenna. Shrink tubing covers the assembly, so it's not immediately obvious.

Stephen,

1. The SSB Mic setting controls the sensitivity of the Microphone. Unless you have a very quite voice 100 is likely too high. If you are using the stock mic I recommend you set it between 35 and 65.

2. Compression controls a circuit deigned to increase the amplitude of the "quiet" parts of speech in an effort to keep the average loudness of your signal up. This sounds like a great idea but frequently just makes you sound distorted. In my testing setting the Compression level above 20 degrades the quality of signal the other station receives. I normally leave compression off.

3. The transmit power is controlled by by Menu 75 or 76 I am not in front of my rig so I can't say for sure. With this set to 100 you should put out close to 100 watts at the peaks of you transmissions. Your average power will be much less. Also, if you are not using a 50 ohm load for you readings the watt meter will not give you accurate numbers.

Hope this helps a little.

Anthony - AE7HS

31592. Re: Transmit Current Draw

Yahoo group: FT897 (2010)
Date: 2010-10-30 04:30:09 UTC
From: Radio_Randy
Topic: 31545 Message: 31592

Phillip,

I measured the following current draws on my 897D. Keep in mind that I used the radio setting (and not a wattmeter) for the power. Also, the draw varies (as mentioned in another reply) per band.

From 1.8 to 50 MHz:

5 watts = 4.0 to 4.7 amps
10 watts = 5.3 to 6.4 amps
25 watts = 7.3 to 9.2 amps
50 watts = 10.6 to 12.9 amps

144 MHz:

5 watts = 3.4 amps
10 watts = 4.2 amps
25 watts = 6.3 amps
50 watts = 9.4 amps

420 MHz:

5 watts = 4.2 amps
10 watts = 5.6 amps
20 watts = 8.7 amps

In each scenario, the standby current (audio squelched) was .6 amps continuous. I did not try to disable the backlight for these tests. Also, the voltage used in the tests was 13.8 vdc.

Keep in mind that these readings were taken with the radio operating on an external DC supply and not via internal batteries. I'm guessing that the current draw is a bit lower with the internal packs.

Hi Guys
i think some of your expectations in using this Ft897 in some cases are a bit unrealistic given what it costs to buy.
this radio has a wide band rf amplifier which is going to be a compromise at best to cover such a bandwidth.
the facilities are also fine for a radio in this price range, the extra mods to this like the so called built in VSWR bridge is not anything but a bit of a gimmick.
the use of some of the cheaper external bridges are actually no better sadly.
my arsenal of equipment includes a bird reflector meter, with the slugs.
accurate current draws are only going to tell you how inefficent this radio is in certain parts of it's range.
this general for a radio of this quality, and i see a major issue that lets most of you down is the use of vertical antenna which have very little metal in the air.
a doublet or even the the G5Rv pattern antenna will give far better results than a small vertical such as the buddipole.
sorry but it all come down to cost and this radio as the advert show is great if you use a key. Regards Robert

Hi Stephen

The normal cause of no S meter reading is that you have the AGC switched off. This will aslo cause distortion on receive on strong signals.

Go to Row L fof the soft-key menu and scheck that the AGC is on, Atuo mode is best for most applications.

31600. no cw transmit

Yahoo group: FT897 (2010)
Date: 2010-10-30 18:46:46 UTC
From: DaniloI
Topic: 31600 Message: 31600

Today with my 897, I was keying CW with my usual vertical key when all of a sudden no more tx on cw.
I even tried to hear CW tone (by disabling "BK" function) but no tone heard.
During operations I experienced some RFI.
I made a full reset of the rig without success.
Rx is ok.
Shall I take my rig to service? A board broken ? Any suggestion?
By the way, SSB/AM/FM tx is ok.
Thanks beforehand for any advice.
73, Danilo IK1XHN

Try all modes into a dummy load, see if the rig seems stable.

If the rig transmits ok into dummy load it may be an external problem

Check power cable from power supply to rig

31603. interference on vhf and UHF

Yahoo group: FT897 (2010)
Date: 2010-10-31 12:35:47 UTC
From: bigiantrike
Topic: 31603 Message: 31603

Hi all
I am experiencing interference - buzzing on receive when listening to strong 2 mtr and 70 cm stations..There is no interference on transmit.
Ive checked all the obvious like power leads and coax connections. I have also tested speakers and get it on extension and internal speakers.

Your suggestions as to the likely cause would be gratefully appreciated.

Ian

Ian,

If it is a low frequency buzz then you are probably hearing the CTCSS of the station you are listening too assuming you are hearing this on FM. Either use a communication speaker with a frequency roll-off at about 300 Hz or use the DSP filter and set the low frequency cutoff to 280 Hz.

More information would be helpful but based on the usual 2 m and 70 cm operation I am guessing this is what you are hearing. Some FM only radio will already filter the frequencies below 300 Hz so that you don't hear these transmitted tones.

Hi Steve
Thanks for the reply.
It is not the ctcss tone the crackle is intermittent and happens on FM when I'm listening to a couple of repeaters.. At first i thought it might have been repeater end and not at the radio...but I'm not sure now..
You know how it is when something is bugging you...lol you start questioning your own findings..lol

From: Steve Yates
Topic: 31603 Message: 31606

Hi Ian,

Here are a couple of other ideas to ponder...

I know this is a long shot, but florescent lights have been know to "phase modulate" a multipath return signal that in some cases is stronger the the direct signal. A phase modulated return is easily demodulated by an FM receiver. I've noticed this if i strategically park near a florescent advertisement sign. The lights are actually conducting plasma that switches on and off at the power line frequency.

An issue we have here in north Texas on 70 cm is the Enhanced Position Location Reporting System (EPLRS). This is a spread spectrum signal that sounds like a popping or crackling sound in FM receivers. It is a primary user on this shared band so we try to get along with it. See here:
http://www.aa5tb.com/sig13.html

In today's world of everything generating RF it could be your coffee pot ;-)

31609. Update on the buetooh adapters.

Yahoo group: FT897 (2010)
Date: 2010-11-01 14:56:10 UTC
From: mchenryproj
Topic: 31609 Message: 31609

It seems the batteries I found a ton of on eBay do fit the Jabra A210 units nicely. These are super cheap and are out there by the bucket full. If you are still interested in the bluetooth project involving the "dead" Jabra devices, read on.

I bought 5 of the dead Jabra devices from this link on eBay for $14.99:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280358911341&ssPageName=STRK:MEWAX:IT

I then bought an ac adapter charger for about $4 from another vendor. I don't have that link saved but they are all over on eBay - Search Jabra AC adapter or similar.

I then bought batteries from here:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=160388243494&ssPageName=STRK:MEWNX:IT

You can search for other multi-packs of these batteries by searching for "150MAH 3.7V 10C E-Flite BLADE" or similar.

I have confirmed all my Jarba units are functional with a good battery. I can connect and use them as I should be able to. They connect easily enough to the headset etc.

I am in the process of swaping the good batteries out for the new ones. I did also find 3 of the exact replacement batts from a cell phone shop that was repairing some sort of units and they are good to go as well.

So, in the end, I have 5 adapters with new batts for a total of about $35, with a little soldering work. The connections are tight on the Jabra boards but you can do it with a magnifying glass and steady hands. This project may not be for everyone. I will post some pics later of the project in motion.

I did build and test a nice adapter cable using a Cat connector and crimper, 2 wires from the cat (pins 4 & 5 for the Jabra audio out to the FT-897d mic in) and a 1/4" headphone out from the front panel connection into an inline 2.5mm stereo (TRS) connector and it works great. I kept the lengths fairly short but it's pretty easy if you have access to an RJ45 crimper set.

If anyone wants me to pre-make cables like mine for other headsets or your own Jabra project, contact me off list and we can chat about it. I have an RJ crimper.

More to come, with pics.

I bought the inline 2.55mm and 1/4" headphone out connector at Universal Radio. You may find them other places but they were convenient for me.

From: Radio_Randy
Topic: 31545 Message: 31612

Hi Geoff,

Thanks for asking that question. I had, indeed, made measurements up to 100 watts on this radio. Here are the results:

1.8 to 50 MHz = 14.3 to 18.0 amps

144 MHz = 9.4 amps@50w

420 MHz = 8.7 amps@20w

Let me know if you desire the "per band" readings and I will email them to you, directly.

Yahoo group: FT897 (2010)
Date: 2010-11-01 17:48:32 UTC
From: Radio_Randy
Topic: 31545 Message: 31613

Hi Robert,

I was assuming, in the original question, that Phillip was looking at "battery life" in a portable situation. That would be why he was only interested in the lower power outputs. My own feelings are that these radios (the FT-897D, IC-706, etc.) are poor choices for portable QRP operation, anyhow, due to the excessive standby draw.

As for the Buddipole, I purchased my package (complete with tripod and carrying bag) for portable operation where supports for a wire antenna were not available. I normally configure it as a dipole versus a vertical, but I've not experimented with it a whole lot. My home station consists of an FT-950 and yagis for 6, 10, 15 and 20 meters on a 40 foot tower. The 897, LDG tuner and Buddipole are just extra "play toys".

Hi Randy
it sounds like you are better placed than most with a 40 ' tower.
the collection of antenna's sounds like heaven to lot of amateurs.
the buddipole how ever is a real compromise as it is a shorten dipole.
we have a similar antenna here in the united kingdom it puts the elements at 45 degrees to one another.
The claims seem to be very good, and we also have a guy in the west of wales selling a similar thing which uses two 10 metre poles at 60 degrees but he has made the mistake of using carbon fibre and the wire is fed up the inside, which means it is shielded and that means all this is, is a 20 metre loop.
which one of our club member's has had a lot of problems with.
I do agree that the two radio's chosen do have short comings but the suggest output in the literature for the ft897 suggested it was ok for 20watts on CW only and no mention of any voice mode Regards robert

My own feelings are that these radios (the FT-897D, IC-706, etc.) are poor choices for portable QRP operation, anyhow, due to the excessive standby draw.

As for the Buddipole, I purchased my package (complete with tripod and carrying bag) for portable operation where supports for a wire antenna were not available. I normally configure it as a dipole versus a vertical, but I've not experimented with it a whole lot. My home station consists of an FT-950 and yagis for 6, 10, 15 and 20 meters on a 40 foot tower. The 897, LDG tuner and Buddipole are just extra "play toys".

31616. Breaking up on 80 Meters

Yahoo group: FT897 (2010)
Date: 2010-11-01 20:09:27 UTC
From: Danny Loyd
Topic: 31616 Message: 31616

I have been waiting until I had tried everything except pulling my hair out to ask this question, but, when I transmit on 80 meters I keep getting reports that my audio is breaking up like I have a bad mic connection. The radio works great on every band, including 160 meters with no reports of breaking up. I have tried two different antennae, a G5RV and Inverted L. Get the same report on both. Could the problem be a mismatch between the rig and antenna even though I show no more than 2:1 SWR when talking on the band?

Any help or answers would be appreciated. Don't want to start making myself bald over this.

Thanks,

Danny

Hi Danny
those RJ45 Connects are not all that brilliant it sometime takes several when trying to fit a new one before you can get them just right.
so i would suggest it is the microphone cable at the connector end that is at fault.

Hi Danny,

pulling your hair out is very unlikely to help!

If this is happening on the one band only, then I suspect that you may have
a problem with RF getting back into the mic on that band.

Is the antenna close to the operating position?

You might try wrapping the mic lead around a piece of ferrite rod or passing
a few turns of it through a ferrite torroid and see if that helps.

Getting the SWR lower may also help too. 2:1 is really a bit high, although
not excessive, and I personally wouldn't operate unless it was below 1.5:1

Hi guys
Jusy what do you expect for the money.
this radio is superior to almost all the comparable radios given how much it cost.
the radio i bought earlier this year when the yen was low against the pound was a liitle over 600 GBP.
today it may be near 900 GBP but it is still excellent value for money.
At the same time. I Bought a Icom 7400 was on special offer at 1300GBP It is the end of the line Version of The Icom 756 Pro.
It has none of the features i keep seeing you guys wanting in a transciever.
In actually fact it has all the features and controls that the Icom 7400 has and some extra's.
As they say you get what you pay for in this life, you could always part exchange it for something better but it will cost a lot more. Regards Robert G6LLP

A G5RV has a very high SWR on 80 Meters like 6:1 or more and frequently automatic tuners burn out the relay for that band. Evenso, if you are using a manual tuner try using a ground of a different length. As a ground length approaches 1/4 wavelength it put the rig at a voltage peak and being voltage fed, the antenna won't tune. A 1/4 wave is pretty long on 80 meters but try a different earthing point. It sounds as if you maybe have Rf getting back into the rig.
Failing that, start looking at the 80 meter output relay and associated tuned filters for loose connections.

Chris,

It is breaking up at all power levels. The feed line is feeding directly to 50 ohm coax into the ATU on the G5RV. The closest leg for the antenna is about 50 ft from the rig running north to south over the roof of the house from the tower with lowest point about 25' off the ground or higher. Middle of antenna is at 48' above ground. The antenna I have is the MFJ 10-80 meter model. It was tuning okay when I first set it up a little over a year ago. Will try putting a ferrite choke on the mic feed line and see what happens.

g5rv may not load correctly on 80m, its designed for20m and a valve output stage, i hope you are running the g5rv twin feeder straight to the coax with no balun at that junction then back to the un un coax of the atu. does the breaking occur at 100w or at all power settings?.
if you the run the efed, again the earth is crucial to use and efeds often have feedback/breakthrough.
is the aerial legs anywhere near the radio or is it all 75' away?

Thanks

Hi guys

check the state of the antenna as i found out some are not put together
very well as the wire is insulated wire and the connections are crimped
on and they do tend to go loose.

when the anteena has been up for a yaer or so so it may be time to
check out all the connections a high vswr is the
indicator Regards \Robert.

31624. Re: Breaking up on 80 Meters

Yahoo group: FT897 (2010)
Date: 2010-11-03 17:36:55 UTC
From: dyarnes1
Topic: 31616 Message: 31624

Everything Jim says is pretty much right based on what I know. The real problem may be, however, that the G5RV is actually a pretty lousy antenna if you are really trying to use it on a lot of different bands. It's been way oversold as to its capabilities, and it's use has been extended far beyond what the designer really intended.

I think the G5RV is a perfect example of what many antenna gurus say--if you put up just about any antenna, of a decent length, it will probably "work". That doesn't mean it will work particularly well! The G5RV was designed to work on 80 and 20 meters--that's all! It was also intended to be used with a tuner, and not one that is meager as to its capabilities.

As Jim points out, most automatic tuners built into today's rigs tend to struggle with loads higher than around 3:1. These tuners are intended to make wider band excursions possible, but not necessarily to facilitate multi-band operation with non-resonant antennas. Elecraft is an exception, as are a few others, but even those aren't capable of dealing with some of the loads you might see on certain bands using a G5RV.

The G5RV complicates things actually. The matching system is really only effective for the bands originally intended. If you really want to have one antenna for multiple bands, you would be much better off getting rid of the coax all together, and using a good balanced line tuner. Even then you might have to fiddle with feedline lengths, but you will definitely be better off overall. It's a much simpler setup overall, and also much more efficient. I think if G5RV users, and potential users, would take the time to read some of the excellent technical analysis articles that have been written about the G5RV, they will better realize why it's not the panacea a lot of folks seem to think it is. By the way, ZS6BKW developed a much better version of the G5RV, which is well worth looking at, but it still doesn't solve a great many of the problems.

Another method of feeding multi-band antennas that has become very popular, and also very effective, is to put your tuner close to the antenna--a remote tuner arrangement. While this is more complicated, it is an excellent alternative, particularly where you want to use coax. Getting the match right, at the antenna (50 ohms), allows you to then use coax without suffering those huge losses in the coax due to the extreme mismatch.

Danny may simply have some mechanical problems in his system--bad coax, bad connections, etc.--but a lot of his problem may be the inherent limitations of this antenna, and the difficulty in overcoming them.

If I might jump in....

I have extremely good performance with my flattop, off center fed dipole. (Also known as, in its various itinerations, as a Windom) I run the non ladder-line version...coax to the 4:1 balun. I do have a roller inductor tuner (TenTec 229) but rarely use it on the Windom as my match is 1.5 or lower, across the board, except for 17 where the match is 1.8.

The wire handles power quite well....I rarely exceed 400 watts but have implemented my L-4B to get through a nasty pile-up or two.

I am quite happy that I 'generally' can talk to anyone I hear.

Just adding my observations......

The best thing I did with my G5RV was to reconfigure it into a "Super Loop" to work multiband. It was a great antenna but came down in an Ice storm and I replaced it with a mini trap dipole.
For the loop design see :
http://www.iw5edi.com/ham-radio/30/super-loop-antenna

The real problem may be, however, that the G5RV is actually a pretty lousy antenna if you are really trying to use it on a lot of different bands. It's been way oversold as to its capabilities, and it's use has been extended far beyond what the designer really intended.
>
> I think the G5RV is a perfect example of what many antenna gurus say--if you put up just about any antenna, of a decent length, it will probably "work". That doesn't mean it will work particularly well! The G5RV was designed to work on 80 and 20 meters--that's all! It was also intended to be used with a tuner, and not one that is meager as to its capabilities.
>
> As Jim points out, most automatic tuners built into today's rigs tend to struggle with loads higher than around 3:1. These tuners are intended to make wider band excursions possible, but not necessarily to facilitate multi-band operation with non-resonant antennas. Elecraft is an exception, as are a few others, but even those aren't capable of dealing with some of the loads you might see on certain bands using a G5RV.
>
> The G5RV complicates things actually. The matching system is really only effective for the bands originally intended. If you really want to have one antenna for multiple bands, you would be much better off getting rid of the coax all together, and using a good balanced line tuner. Even then you might have to fiddle with feedline lengths, but you will definitely be better off overall. It's a much simpler setup overall, and also much more efficient. I think if G5RV users, and potential users, would take the time to read some of the excellent technical analysis articles that have been written about the G5RV, they will better realize why it's not the panacea a lot of folks seem to think it is. By the way, ZS6BKW developed a much better version of the G5RV, which is well worth looking at, but it still doesn't solve a great many of the problems.
>
> Another method of feeding multi-band antennas that has become very popular, and also very effective, is to put your tuner close to the antenna--a remote tuner arrangement. While this is more complicated, it is an excellent alternative, particularly where you want to use coax. Getting the match right, at the antenna (50 ohms), allows you to then use coax without suffering those huge losses in the coax due to the extreme mismatch.
>
> Danny may simply have some mechanical problems in his system--bad coax, bad connections,

etc.--but a lot of his problem may be the inherent limitations of this antenna, and the difficulty in overcoming them.
>
> Dave W7AQK
>
> --- In FT897@yahoogroups.com, "Pronto. (Military)" <portdoverbells@> wrote:
> >
> > A G5RV has a very high SWR on 80 Meters like 6:1 or more and frequently automatic tuners burn out the relay for that band. Evenso, if you are using a manual tuner try using a ground of a different length. As a ground length approaches 1/4 wavelength it put the rig at a voltage peak and being voltage fed, the antenna won't tune. A 1/4 wave is pretty long on 80 meters but try a different earthing point. It sounds as if you maybe have Rf getting back into the rig.

31627. FT_897D - HRD problem...

Yahoo group: FT897 (2010)
Date: 2010-11-04 15:37:14 UTC
From: gefi_can
Topic: 31627 Message: 31627

Hallo Guys..

I need your advice and opinion.... I successfully connected my Desktop PC (CPU 3 MHz /4MB RAM...) to FT897D rig with orig. Yaesu CAT cable.
The HRD program promptly recognized my FT rig.... everything was working fine for few weeks. Suddenly I got one strange problem.
On freq. 14 MHz I can hear all kind of noises coming from my PC....
I can even hear mouse click and I can also hear my Hard Disk activities an scrolling on the screen.
I unplugged radio from external power supply and plugged radio on
12 Volt car battery and I used Laptop running also on battery and I switched off all breakers in my Condo and the sound was still there. Freq 14 MHz was OK but 3.5 MHz was bad...The sound coming from FT speaker is similar to the sound as old diesel car running on free.
I don't have any problem with my FT rig when CAT cable is disconnected from radio. I tried 5 PCs and the sound was still there.... and what now...? The CAT cable is brand new.

Any suggestions are welcome....

Thank you....
Peter OM3TLP.

So from what I read you had the same problem with both antennas; therefore this isn't an antenna problem. Do you use an RF isolator or 1:1 balun on your transmission line? What I would start with is putting a dummy load and SWR meter at the output of the antenna. You can use an incandescent light at a wattage higher than what you are putting out as the dummy load (old school).

Switch to AM or CW, to get a carrier, and key down or hold the mike and check the SWR on 80 meters and another frequency. It should be 1:1 or there abouts.

Now move the dummy load, leaving the SWR meter where it is, to the end of the coax feed line. Repeat the test. The SWR should be around 1:2 or less. If not you have a coax problem, most likely a connector. If the coax is good then you can add the balun into the line, if you use one, and test that as well.

This may help isolate the problem, if its RF related. It can still be something in the rig, perhaps a bad component in the AF circuitry that has become sensitive to some leaky RF in the 80 m band.

Also, I am assuming you our at least using a 1:1 balun or RF isolator (ferrite beads) to kill RF being reflected back to your radio via the coax shield.

Hi Joe
we have an older member in the local radio club who reckons the only reason louis verney antenna the G5RV is only 105 feet long is because it was the length of his garden. I think given thought to it and came up with the same conclusion that most people have it may be ok on 20 metres and 40 metres but when the connections start to deteriate over time. The vswr seems to change and not for the better, it is time to replace it with a new one. The problem is what it is supposed to be and what is sold as a G5RV is the real problem. some times you get crimped connections and a cable connection at the bottom of the ladder line that is not a 1:1 balun but just a connector that connects ladder line to a so 230 socket which is connecte to the coax lead in.
this connection on many occaisions is filled with water hence the high vswr.
I have replaced mine with a proper 1:1 balun and the results speak for themselves.
Regards
Robert.

If I might jump in....

I have extremely good performance with my flattop, off center fed dipole.

(Also known as, in its various itinerations, as a Windom) I run the non

ladder-line version...coax to the 4:1 balun. I do have a roller inductor

tuner (TenTec 229) but rarely use it on the Windom as my match is 1.5 or

lower, across the board, except for 17 where the match is 1.8.

The wire handles power quite well....I rarely exceed 400 watts but have

implemented my L-4B to get through a nasty pile-up or two.

I am quite happy that I 'generally' can talk to anyone I hear.

Just adding my observations......

Danny,

Have you tested your transmitter into a dummy load? If it breaks up there, your problem is with your radio.

Peter,

My first suggestion is to check your CAT cable out with an ohmmeter. It sounds like you might have broken a ground conductor.

Normal stuff.
You can minimize the noise by making sure you connect at no higher than 9600 baud... which is plenty fast.

I also use an OCF dipole with a LDG tuner for the FT-897D. Won't work with the standard Yaesu tuner, not enough range. I have it set up in the Carolina style for 40 m, I found that worked better for me than the standard Windom arrangement. I can tune up and use most of the 80 meter band, 40m, 20m, 15m (most likely the vertical component), and 10 m. I can't tune on 60 m or 160 m. There is a Yahoo Windom group.

Probably the long way to do it, but I think it's a matter on manual tuning,
ie manually tuning from 50 down, or 33 up. I don't know of a quick method

Subject: [FT897] how to access 42.8mhz receive

the manual says continuous receive coverage 1-54 i think
i cannot figure out , after paging through manual, how to access between
33mhz-50mhz
could someone please help
thank you

thanks- just came back to group- figured it out- not in manual- but
you go to 50mhz and then go down
thanks
but play, play, play and you finally can figure it out

31644. Re: [FT897] Re: Breaking up on 80 Meters

Yahoo group: FT897 (2010)
Date: 2010-11-06 00:39:27 UTC
From: Danny Loyd
Topic: 31616 Message: 31644

Thanks for all the responses. I started with easiest thing to do, I put a ferrite choke on the mic line to the radio and that seems to have fixed the problem. I got on the 80 meter OMISS net last night and got 59 signals with no break up in the audio. I am hoping this has fixed this little problem.

Danny,

Have you tested your transmitter into a dummy load? If it breaks up there, your problem is with your radio.

31645. Telix Air (Goverment Issue) headset with boom mic

Yahoo group: FT897 (2010)
Date: 2010-10-29 00:16:39 UTC
From: kz4zzz@att.net
Topic: 31645 Message: 31645

Headset Unit has 2 x 1/4 inch plugs I tried the one plug and it works great plugged into the front audio out of my 897D, but I need a adapter for the mic plug so I can use the boom mic in the vox or ptt mode. Does anyone have plans to make one or better yet have one that justs let me plug into a 8 pin adapter to the two the 1/4 plugs thats attached to the telix so I wouldn't have to use the 1/4 jack in the front as I need the audio out in the back to feed my sound card. when I use the fron't it disco's the back. Seems like standard wiring but I want something that has a interface so I can use the 59 mic or the telix. just a simple plug in. Photo of interface would be great !

From: Williamk
Topic: 31646 Message: 31646

Hi Y'all from the Florida Keys,

If you were to but an FT-897 today what additional filters or accessories would you suggest? Please state the ones you would and would NOT add to the cost of the radio. I am about to pull the trigger, your advice is important. My use would be the rig I take everywhere, home, on the boat, camping and on the road. I believe it fits both my 'emergency' need and my Boy we can have some fun stuff. My newest piece of equipment is an ICOM 735, almost 20 years old now and having problems. My old faithful is a Gonset 100 transmitter and a Heathkit RX-1 receiver. All my VHF stuff died over the years.

Thanks,
Bill

Topic: 31549 Message: 31648

Let's say your radio was set on 2 meters near 147.150 or so. and
when you keyed the set the freq. would show 147.750 that would be normal. The 897d has the repeater shift built into the 2 meter band where repeaters are used...some areas use a - shift. As for the diople you needed a ground to make it work and since the antenna wasn't grounded till you grounded the radio thus grounding the antenna with the shield of the rg8x from your rig.

31651. Re: FT897D power output

Yahoo group: FT897 (2010)
Date: 2010-10-29 11:39:40 UTC
From: ai4wu
Topic: 31578 Message: 31651

Hi Stephen,

There are a couple of points you mention that are based on incorrect assumptions.

1. SSB mic gain probably should not be at 100. The number in this menu is just a relative gain level, not a power level in watts. This should be adjusted based on your particular voice, how closely you hold the mic, which mic you're using, etc. Adjust your mic gain by starting low and increasing until you see no more increase in power output, then back up a few points to ensure you aren't over driving. ALC will usually keep you from exceeding 100 watts, but too much ALC can cause your signal to become distorted.

2. Speech processing is also a relative number, not related to power output. Use of compression is optional and should almost never be at 100. It's purpose is to increase average power by increasing the low level audio between syllables and is not really necessary most of the time. When I use it at all, mine is usually in the 20 - 40 range. Again, too much will cause distortion.

3. Don't put too much emphasis on power output displayed on a meter. Even a good peak reading meter is not a perfect indicator of output power. Your 801 is a pretty good meter, but it must be set for peak not average, and it must have power applied to read peak. Even then, different voices will cause the meter to react differently, so it may not indicate 100 watts all the time on all bands. Don't lose sleep over it!

Hi Bill,

We use the 897 as a home unit as well as portable.
Presently we are using an LDG AT-897 Plus auto tuner and an
LDG FT meter; both are made to work specifically with the 897 rig.
If you plan to do any digital work, we also have a Signalink USB Sound Card
Interface
that does a great job.

We didn't purchase any filters or battery packs, bought a small sealed battery
at Cabela's about

a year ago, I think it's meant for a dirt bike or snow mobile, but it is light
and works fine.
At home we use the Alinco DM-330 for a power supply.

For a portable antenna we use a Chameleon V11 that covers 80 m to 6m.
We hook it up using four 4ft masts and a 5ft roof tripod.
System fits in the trunk of the cars fine and we've had great results both voice
and digital with that set up.

I would add a SignaLink USB sound interface and a CG-3000 ATU, all quite cheap items, as I use mainly this rig aboard my sailboat and mostly on digital modes (Winmor, jpskmail and fldigi,) for e-mailing, getting txt web pages and grib or other meteo files.
Very nice rig.

A name would be nice,

I'm not sure what you mean by an interface difference but I chose the FT897d for base/portable use because I could install batteries in the base and the LDG AT897 tuner attaches to the side.

I think if I was looking to operate mobile then price would come into the equation. Both appear to have mobile mounting capabilities and you need to get power into the radio (from a battery?). You also need to check the size. I think the 857 is smaller.

I have never studied the 857 but from a quick look at the CAT capabilities of both radios there seems to be little if any operational difference. Sort of read the manual and adapt accordingly.

Topic: 31646 Message: 31658

I've owned an FT-897 for two years. I use it as a base station rig as well as a portable rig on vacations. I also use it for EmComm exercises and public service work (mostly portable).

Knowing what I know now, I would buy an Icom IC-7000 instead.

I do a lot of digital and the audio DSP in the 897 is basically useless for digital. Even with an add-on 300 Hz mechanical filter (from W4RT), the 897 is a problem with tightly packed PSK signals.

The Icom, on the other hand, has IF DSP (which is much better for digital) plus digital filtering that goes down to 50 Hz plus manual notch filtering -- all of which make digital on the IC-7000 much much easier.

If you're going to go for the FT-897 anyway, definitely get some filters from W4RT. You can get the same Collins filters, but W4RT seems to be just as good and a lot less expensive. In addition:

1. The autotuners built specifically for the FT-897 (e.g., the LDG AT-897) just do not have the range of a good external manual tuner. If you're going to be portable or mobile or just using a less-than-optimal base station multi-band antenna, you'll be much better off with a good external wide-ranging tuner like an MFJ-941E (or equivalent auto-tuner).

2. A lot of people go with the W4RT internal battery for the 897. I prefer an external battery, but definitely get one for your portable operations.

3. If you think you're going to be doing any sort of VHF/UHF operations, get the microphone with the DTMF number/letter pad for Echolink, IRLP, and DTMF operations.

4. I use my FT-897 with a Buddipole and with a TAK-tenna for portable ops and EmComm. They both do excellent jobs with the FT-897.

From: Eric van de Weyer
Topic: 31649 Message: 31659

I have both the 857 (2) and the 897.

For mobile the 857 is the better unit due to its smaller size and the capability of running the head remotely. I have the radios mounted under the front seat of the cars with the heads mounted in the dash, under the car radio/CD as it fits in the standard slot.

The 897 is much larger, has the capability of having either a built in power supply or 2 batteries for portable use. Its larger size will make it more difficult to mount in a car.

As far as the radios themselves are concerned, they are basically the same radio in different housings.

I originally bought the 897 to be a home/portable rig and, at the time, I had FT100s in both cars. I subsequently bought 2 857s for the cars as the 100s were having a few problems and I am now, once I have fixed up the 100s going to use them for the base station and the 897 will be for portable use only.

If you are wanting to use it for mobile use, I would recommend the 857D. I have the 897D and I love it. I don't know of any radio that provides so much for under $900.00. The 857D and 897D are electrically identical, so either one will provide the same performance. However, the 897D is a much bigger radio, and does not have a detachable faceplate, so mobile use would be more difficult.

My use is strictly base use and possibly portable use in the future. I was looking at the 857, but then got to play with the 897 at the Orlando Hamcation. Because it is a bigger radio, the front panel was easier to see and buttons had more room, so I was less likely to fat-finger it. I do plan on adding an 857 to my Honda Element next year.

From: Hank
Topic: 31654 Message: 31663

For all of the uses you are wanting to use it for, I would suggest the LDG AT-897+ automatic antenna tuner, the LDG FT-Meter external meter, the W4RT filters, W4RT internal batteries, and the Yaesu MH-36E8J DTMF hand mic.

I am using the LDG AT-897 tuner and FT-Meter, and love both of them. For a desk mic, I am using the Yaesu MD-100A8X, but have the MH-36E8J plugged into the back of it for DTMF use. I am going to add the filters real soon.

If you are planning on doing any digital work, you will need a computer interface such as the SignaLink SL-1 or Rigblaster Data Jack PnP. I am using the Rigblaster PnP and like it. There are no jumpers to configure, but the installation does require you to follow the order of installation. I have had mine running for over a year now, and haven't had to touch it since I installed it.

Hope this helps.

Date: 2010-11-06 19:32:02 UTC
From: Carl Wulfestieg
Topic: 31652 Message: 31664

Adrian-
The FT-897D Receives : 0.1-56 MHz, 76-108 MHz, 118-164 MHz, 420-470 MHz
and Transmits: 160 - 6 Meters, 2 Meters, 70 Centimeters (Amateur bands only),
5.1675 MHz (Alaska Emergency Frequency: USA only)

"Widebanding" is an electronic alteration that allows the FT-897 to operate outside of the above frequencies. It is accomplished by physically changing the "jumpers" in the radio. It is generally of use and is an advantage to those who are associated with Civil Air Patrol (CAP) or Military Affiliate Radio System (MARS) and have appropriate authorization.

In regard to "European and Other" frequencies, the ones you are concerned with may already be in the above list of frequencies. If not, "Widebanding" may allow the FT-897D to operate on the frequencies you are interested in. However, a US Amateur must still transmit within the US Amateur Bands. QSO's with your European friends could still be accomplished by both parties working appropriate "split bands".

Normal stuff.

You can minimize the noise by making sure you connect at no higher than 9600 baud... which is plenty fast.

31668. Re: ft897d vs ft857d

Yahoo group: FT897 (2010)
Date: 2010-11-07 16:46:20 UTC
From: ke7adu
Topic: 31649 Message: 31668

I have had and 897, 857, and an 817. Of those I still own the 897 for the following reasons:

1. TCXO (can be added two the 857 for $100)
2. Internal battery pack is nice. I use the w4rt set and get about 7 hours receive per battery. Transmitting a lot will shorten that up a lot.
3. Carying handle

I have found the display easy to read on both radios. The colors are more vivid on the 857 but the screen is largeer on the 897 which could be helpful as your eyes age.

Summary: If I could only have one and I planed to use the rado mobile frequently I would buy the 857 for it's ease of mounting. If it will be use mostly at home with some portable use I would get the 897. If you plan to operate digital add TCXO to the 857.

I chose the 897D for the following reasons:

Ergonomics - I liked the button/knob setup much better
TCXO standard - I use mine on government HF channels as well
Space for an internal P.S. - Don't bother, mine was noisy (RFI)

I must say the 857 is likely the better choice if you are determined to go mobile with it. Of course, the IC-706MKIIG is also an excellent choice for this and somewhat (from what I've read) more popular.

Why don't you do like me and just buy the FT-950 for a base rig. That way, your choice for a mobile rig is simpler, HI!

Bill,

I have the LDG AT100Pro external tuner. It is useable on radios other than just the 897D, holds its own internal batteries and will match a wider range of impedances. With the LDG 4:1 balun and a doublet antenna (with window line, not a G5RV), you can operate most all HF bands with ease.

The internal batteries are fine if you don't mind 20 watts output and about 4 hours of operating time, total, for a couple hundred bucks extra.

The internal power supply is really nice, if you can find one that doesn't cause RFI on any of the frequencies you plan on operating. The one I had trashed 6 meters, so I sold it.

The W4RT SSB filter is a nice addition. Unfortunately, a narrower unit is not yet offered.

The BuddiPole antenna kit could be handy in some situations. Although it is physically small and inefficient related to a larger dipole, it could be useful if you have no other antenna supports available. You could even set it up in a small boat if desired. Keep in mind that a tuner or impedance transformer may be needed for the 40 meter band as the antenna is pretty close to the ground.

Get additional power cables and Anderson PowerPole connectors for them. The factory cable has a fair amount of voltage drop. I would like to get a couple extras that could be shortened. Then, I would rely on the fusing in my supply network.

As for the interface cables for use with sound cards, etc., I like to scrounge the PS2 cords from older mice and keyboards to make my own. Just make sure ALL the pins and wires are there as some peripherals don't use them all. BTW, these cables will not fit the CAT interface. You will have to locate those, separately.

Appanna,

Along with the suggestion to check the back of your owner's manual, you also need antennas for BOTH bands to do this properly. Since there is only one antenna port for VHF/UHF, I purchased a diplexer from Diamond. The radio feeds one input and a separate output goes to each antenna.

Hi Bill,

Weren't those IC-735s great! I also had one for 18 years and sold it after I picked up my new 897D.

One accessory I did not include in my previous response was the W4RT 300 Hz filter (not the 500 Hz unit). Although I'm not big into CW, the narrow filter should help a great deal when operating PSK31 and some of the other digital modes.

Answers to your questions mostly depend on what you would like to do with
your "toy".
Just to mention one, I use almost all the time digimodes (PSK31 mainly) at
home, so the CAT cable is a "must" to drive the rig, but an internal power
supply and/or batteries are totally useless to me.

About additional filters, I think you can do everything you need even
without them, but I hope someone more expert than me can tell you much more.

A couple of weeks ago, a kind OM friend posted some advices to put batteries
inside our "toy" to work portable saving lots of money for Yaesu original
accessories (I don't know in the US, but here in Italy they are terribly
expensive!). Give a look at the archives and you'll find some good clues.

HPE CUAGN!

Morning Bill

I have the FT950, and 857 for mobile.

For a 2 mtr rig in the house and for /p and visiting other locations.

The FT897 fitted with the LDG AT897 Plus, The changed base unit to give one mains with no requirement for an external PSU and the relevant Cat cable to program QGR's if I wish from the G4HFQ programing tool

http://www.g4hfq.co.uk/

As you remove the battery base from the FT897 to install the internal PSU you only then need to consider the batteries purchase if you are going up a hill, or there is no 12v DC on the boat.

To conclude, I have the FT950 as a base station.

The FT857 for true mobile (Car)

And the FT897 fills the rest of get out and about operations

Regards (73)

I just sold an ft1000mp in an effor to downsize so the ft950 is not on the table. Is the IC-706MKIIG a better rig than the ft897d ? I am not sure if having the ability to put a battery, ac power in the enclosure are worth it. I do like the ability to bolt the tuner to the side. I can pick up a ft857d along with tuner and power supply for $850.

31677. Another new battery pack

Yahoo group: FT897 (2010)
Date: 2010-11-08 22:52:50 UTC
From: mchenryproj
Topic: 31677 Message: 31677

Just in case anyone may have missed this, the Buddipole folks now have A123 packs at seemingly competitive pricing to the other packs out there. I just wrote them asking if they plan on packaging a version specifically for the 897d. If I get a good response I'll let you all know what they say. Looks like their single packs are small and you might be able to fit 4 of them in the radio. Total capacity would be a bit larger as their "4" version has 9.2 AH but at - 13.2 vdc. That should mean longer running time as the curve on the batteries will take you farther. Instead of dropping off from 12vdc to 10.5vdc (or so) you get to follow the curve downward from 13.2vdc.

Worth looking into. If anyone goes this route, let us know. I mentioned they would want to add correct connectors for the Yaesu internal connections or at least make a short adapter from the Anderson Power Pole to what we would need. maybe a "Y" and let a set of power poles dangle out the opening in the rear for charging?

Buddipole batteries: http://www.buddipole.com/4sa1bapa2.html

The 9.2 AH 13.2 vdc pack is running $285. A bit steep for a battery for me.

31678. HF range - Help :)

Yahoo group: FT897 (2010)
Date: 2010-11-08 23:00:38 UTC
From: Damien Gardner Jnr
Topic: 31678 Message: 31678

Hi Folks,

Sorry, I know this technically isn't the right place to ask this question, but I wasn't quite sure where I should be asking it :)

I've had my FT897 for many many years now.. it works GREAT in the car (though now replaced in the car with a permanently mounted FT857), with a whip for 30m aprs. And it *was* working fine a few years ago (I've moved around a bit since then) for APRS from the shack also.. Note: APRS is about all i've ever used it for..

Anyhow, I've been trying to use PSK31 (and for that matter even voice! - which is a rare occurance for me..) for about the last 12 months, without much success.. - I can hear folks fine, but except for one New Caledonian station about 3 years ago (so a previous shack+antenna layout), noone ever seems to hear me. I figured ok, that's HF for you.. But on sunday I was sitting there listening to folks doing PSK31 on 7035.15, and heard one station come in whooping out over S9. A quick callsign lookup tells me he's only 5km away. Here's my chance i thought, and replied to his CQ. And proceeded to spend the next hour replying to his CQ's, without response.. I thought maybe I wasn't far enough afield for him to bother replying, so shot him a quick email - but no, he definitely hadn't heard me!

Now I'm assuming that he's probably pumping out a fair whack of power, as the 2m extendable whip on my PCR1000 couldn't hear him at all, though the 8.5m TEV-1 sitting on top of the 8m tower in the back yard was getting him on the FT897 at S9+.

So I guess my question is.. - is the 897 just REALLY sensitive, and so I'm hearing folks I don't have a hope of transmitting to? SHOULD I be heard by someone 10km away on 7mhz? I'd have thought at that range, if I can hear him, he's going to hear me.. I"m kinda wondering whether I have something setup wrong, whether it's in software or hardware, or if I'm just expecting more than I should be?

Any thoughts much appreciated :)

Randy,

I must respectfully disagree with you on the caps lock issue. I believe that good operating practice is as important on the Internet as it is in ham radio. Do we not politely correct those that are not quite up to speed on radio operating procedure? Also , I appreciate it when my mistakes are pointed out. It helps me become better at what I do. If done in a polite manner I think correction shows more respect than letting the issue slide.

Thanks for reading,

Damien,

Seems like it could be 897 setup so this is the right place to start.

You don't say how you are getting your data into the FT897d on digital.

If you are using the Mic in then you need to be in SSB mode and if the data socket on the back then digi mode. When you are transmitting is your output power meter showing a reading? Check the data coming into the 897 is sufficient to drive the rig if there is no power reading. You may need to connect a dummy load to investigate.

As to a local station (5km) you may have difficulty as you will be on groundwave. Depends on your output power.

I have had problems not being heard on SSB but on my 897 30watts PSK31 with a 65 foot wire in an inverted L max height 33 feet and an AT897 tuner I make Australia from the UK. Also a few CQ calls on a band I can hear BPSK31 signals I usually get a reply.

A few thoughts:

Check your radio inputs as already noted.

If you have a second receiver (even an HT with a wideband receiver) see if you can hear yourself when transmitting. You should be able to get a sense of whether you're properly modulating. There's been a good bit of discussion in this group on input levels and ALC use.

Watch the spotter sites like www.pskreporter.info when you're transmitting digital. Even if nobody responds to you, there are enough listeners that you're likely to get spotted.

tg.

Hi
why all this nonsense any way, it's radio you should be talking about not the case of characters in a sentence.
when i first saw this load of nonsense i thought it was about a sensible subject like entering data to a computer as when i started with computers we used UNIX and then they are case sensitive. but no it's some silly person getting all official about language.
the caps lock is not an issue it's better than poor spelling and diction.

Regards

Robert.

I think Colin covered it pretty well if the problem is the interface from the computer to the rig.

You did mention that you're having trouble with voice also, so that could indicate some other problem, including a problem with your antenna and antenna connection.

To help you better, we need to know more about your setup, including what you're using for a tuner (the Tet-Emtron site says that the TEV-1 needs a tuner), how you have the antenna mounted, how you have the antenna grounded (or a counterpoise). Also, we need to confirm that you have the antenna into the correct antenna jack in the back and that you're in the correct mode for the band you're using. Please also include your menu settings for anything related to digital or phone, including things like digital gain (menu 037), digital mode (menu 038), digital shift (menu 039), digital vox if you're using vox (menu 040), dsp settings (menus 045 thru 049), mic select (menu 059), SSB mic gain (menu 081), vox gain if you're using vox (menu 088).

Generally speaking, the difference between no signal and S9+ is not receiver sensitivity, it's the antenna. Also, an antenna that can hear real well might not send real well if it's not properly tuned and grounded/counterpoised (is there such a word as 'counterpoised'??).

I may be wrong, but I don't think PowerPole connectors to charge the internal batts will work. The reason is that most power supplys offer 13.8 vdc and I believe Yaesu's charging unit actually raises the voltage to what is needed by the battery (around 14.2 vdc I imagine), as well as being a charging regulator.

Oh sure, the batteries will charge, they just won't last as long. You may still have to get the Yaesu box to do it right.

> Just in case anyone may have missed this, the Buddipole folks now have A123 packs at seemingly competitive pricing to the other packs out there. I just wrote them asking if they plan on packaging a version specifically for the 897d. If I get a good response I'll let you all know what they say. Looks like their single packs are small and you might be able to fit 4 of them in the radio. Total capacity would be a bit larger as their "4" version has 9.2 AH but at - 13.2 vdc. That should mean longer running time as the curve on the batteries will take you farther. Instead of dropping off from 12vdc to 10.5vdc (or so) you get to follow the curve downward from 13.2vdc.
>
> Worth looking into. If anyone goes this route, let us know. I mentioned they would want to add correct connectors for the Yaesu internal connections or at least make a short adapter from the Anderson Power Pole to what we would need. maybe a "Y" and let a set of power poles dangle out the opening in the rear for charging?

Damien,

Do you have a receiver you could listen to yourself on? That and insuring power output with an "external" meter would be my first steps in troubleshooting. Don't rely on the internal meter in case there is a problem with your radio.

I think I am misunderstanding what you said Randy.

My Pride mobility scooter charges at 18 volts through a pair of 50 amp Powerpoles.

And in my car, all the power connections are Powerpoles and the charging system in the car will peak at 14.2 volts. Power delivery has never been a problem.

Damien,

Also check a couple of things on the FT-897.

1. Make sure the Mic Processor is not turned on. I have found that when that is turned on the signal will not modulate the radio.
2. Make sure you are in USB and your Menu 38 is in PSK31-U.
3. If you are using a Signalink USB or something similiar make sure your software is set up to use that as your sound card.

Hi Randy, and all

I've had an amazing amount of responses (private and on-list), and have a lot of things to look at!

I'm listening to myself on the Icom PCR-1000 at the moment.. Just about to wire up another data port->soundcard interface and fire up the toughbook on the 857 in the car and go for a drive, VNC'd back to home so I can trigger off CQ transmits to see what I can hear..

But I have one (probably stupid) question.. how DO you measure your power output with an 'external' meter? I have my old radio shack (tandy) SWR/Power meter (well actually I have a few, but this one is 1.8-200mhz, 0-200W), which I use for tuning my fixed-freq whip in the car (no ATU there). As soon as I plug it in between the AT-897 and the antenna coax, the radio flashes high swr, and drops itself down to what looks to be about 2W output - I'm guessing that's because the meter is changing the match to the antenna? Is it safe to just hit tune, and let the ATU sort out the antenna+meter? Or should I be popping it in between the radio and the ATU?

Or should I be buying a completely different meter? ;)

I note that PSK reporting site says it heard me 100 or so days ago - would be nice if it said what band it heard me on!

I'm wondering if my ugly balun fixed my huge-amounts-of-RF-in-the-shack problem, but hid a bigger problem (that you're not supposed to mount an 8.5M vertical on top of a 7.5m mast, unless you've got a proper ground plane sitting right underneath the bottom of the antenna), which I'm still going to have to deal with? (look back on the group to the 14th of August ;))

Cheers,

Damien

And it *was* working fine a few years ago (I've moved around a bit since then) for APRS from the shack also.. Note: APRS is about all i've ever used it for..
>>
>> Anyhow, I've been trying to use PSK31 (and for that matter even voice! - which is a rare occurance for me..) for about the last 12 months, without much success.. - I can hear folks fine, but except for one New Caledonian station about 3 years ago (so a previous shack+antenna layout), noone ever seems to hear me. I figured ok, that's HF for you.. But on sunday I was sitting there listening to folks doing PSK31 on 7035.15, and heard one station come in whooping out over S9. A quick callsign lookup tells me he's only 5km away. Here's my chance i thought, and replied to his CQ. And proceeded to spend the next hour replying to his CQ's, without response.. I thought maybe I wasn't far enough afield for him to bother replying, so shot him a quick email - but no, he definitely hadn't heard me!
>>
>> Now I'm assuming that he's probably pumping out a fair whack of power, as the 2m extendable whip on my PCR1000 couldn't hear him at all, though the 8.5m TEV-1 sitting on top of the 8m tower in the back yard was getting him on the FT897 at S9+.
>>
>> So I guess my question is.. - is the 897 just REALLY sensitive, and so I'm hearing folks I don't have a hope of transmitting to? SHOULD I be heard by someone 10km away on 7mhz? I'd have thought at that range, if I can hear him, he's going to hear me.. I"m kinda wondering whether I have something setup wrong, whether it's in software or hardware, or if I'm just expecting more than I should be?
>>
>> Any thoughts much appreciated :)

31694. Re: HF range - Help :)

Yahoo group: FT897 (2010)
Date: 2010-11-10 07:14:47 UTC
From: colin.bell99
Topic: 31678 Message: 31694

Damien,

Any 'how do you do it' is bound to produce at least 2 ways.

My method of measuring RF output is to put the meter on a 1m coax lead from the radio antenna socket and then connect a dummy load to the other side of the meter.

However I can see no reason why you shouldn't do it your way but I always start off with low power and once I have proved all the bits are working OK I then up the power to the level I want to test at. When you are indicating high swr you are putting stress (even though the radio takes action to reduce the stress) on the output stages.

When the FT897 detects high SWR I believe it lowers the power to 20 watts. I have noticed on my set up when I have high RF in the shack my power on the 897 meter reads about 5 watts and the ALC indicates maximum but I don't see the high swr indicator.

To provoke another possible discussion you mention your aerial and radials or a groundplane. In the UK there is at least one vertical (only 4.5 metres though, manufactured by the Snowdon Radio Company, the SRC X80) that uses a 9:1 unun instead of radials. I can confirm with 20m of wire in an inverted L that a 9:1 unun and a tuner that is earthed will work with no radials.

31696. Hat cable to use for programming the memory

Yahoo group: FT897 (2010)
Date: 2010-11-10 14:03:58 UTC
From: Ian
Topic: 31696 Message: 31696

Hello,

I would like to program the memory of my FT897D from my PC and need a cable. I'm assuming that I need a cable that connects to the data port and not the CAT port, is this assumption correct? Looking on the internet there seems to be serial and usb cables, what would be the recommended one or are they as good as each other? I'd also like to try out PSK31, can I use the same cable or is there a different approach?

So, what your saying is since I'm not associated with the military I should not bother with widebanding. And, I should try to find frequencies that are on my friends and my radio and use them for contact.

Where can I find a list of the frequencies that are used oversease?

Thanks for the info.

31701. Re: Another new battery pack

Yahoo group: FT897 (2010)
Date: 2010-11-10 16:39:07 UTC
From: mchenryproj
Topic: 31677 Message: 31701

I think I know where he was going but let me clarify this one. Power Poles are voltage independent up to their current rating and all that. On these batteries, the powerpole connector is tied directly to the battery so 13.8 applied to them or through a properly built charger will put the charge directly to these batteries in their present configuration. I ave a letter the Buddipole folks sent me that I will reprint here. It is a letter they received from another Amateur about this issue. Quoted below with my original question to them.

_____ begin quote _____

Hi Sean,

Thanks for your email. Our 4S1P packs will fit, but it's a stretch. One customer has done that already. Ideally we'd have some different sized cells to work with but unfortunately that's not going to be possible with the available A123 formats. Here's a posting that N4TZH made to our Buddipole User's Group:

Let me first say I love Buddipole A123 batteries! I already have the 4S2P and charger.

I recently bought a used FT-897. I really liked the idea of having a self contained radio for portable ops.
I didn't want to go with the Yaesu FNB-78, so I called up Chris at Buddipole to inquire about an A123 option.
We compared the dimensions of the FNB-78 and the 4S1P pack. The length and width were well under the size limit
required and the thickness was just a little bigger. I decided to give it a try based on the squishy-ness of the
double heat shrink wrap used on the 4S1P.

Well it is a tight fit. The balancing charging connection comes out of the hole where the Yaesu charge plug would
go and I rigged an adapter to the power poles using some red butt connectors and wire going to the 'A' battery connector
in the radio.

The pins on the radio are as follows:

Left to Right (Right side being nearest to case)

Top

o o o (A)
1 2 3
o o o (B)

1 - Positive
2 - Voltage sense (Not used in this application)

3 - Negative

I only made connection to the 'A' battery and didn't use the voltage sense wire.
I haven't had time to play yet,
so I can't say how long it will last. More to come :-)

Pictures can be found in the photos section under N4TZH.

73,
Don
N4TZH

I wish I had a better answer for you but this seems to be about as good as we've been able to get with the A123's so far.

Any chance you'll be reworking the packaging in the near future to fit inside the FT-897d Yaesu radios? There are a lot of us looking for better technology and slightly higher voltage packs. Prepackaged with the proper Yaesu connectors, or, a short adapter cable from power pole to the Yaesu internal connection point connector might be good too. These look substantially smaller for higher voltage output than the overpriced Yaesu versions. Just wondering.

31702. Re: Transmit UHF and Receive VHF

Yahoo group: FT897 (2010)
Date: 2010-11-10 16:48:55 UTC
From: mchenryproj
Topic: 31653 Message: 31702

Try a discone antenna. Compact, works well on many VHF/UHF freqs and you can stick a 6m loaded ant on top for 6m - 1300MHz coverage in tx as well as rx. I have used these before and they make a decent base antenna if DX isn't your game.

Alternatives are looking at building a simple set of crossed yagis and using a duplexer for the radio itself.

For what you are looking to do, normally one would use a relay to flip from one antenna to the other (UHF TX and VHF RX) that does this flip on key up. These use pin diodes to detect transmission and close a relay as long as you transmit. At low power you can use other devices. Look at other dual band antennas as well. Eggbeaters are common (or used to be) for sat work. Most common now is a simple crossed Yagi. The Arrow Antenna is designed for this type of thing.

Hope those help a bit. By the way, you can build a Discone for VHF+ easily with a PL-239 connector and wire pulled from common 2-14 house wiring, etc. I used the aluminum grounding wire RatShack used to sell when I made mine years ago.

> Damien,
>
> Seems like it could be 897 setup so this is the right place to start.
>
> You don't say how you are getting your data into the FT897d on digital.
Sorry, Running HRD+DM780. DM780 is set to use one of the sound cards in
the PC (there's four ;)), and HRD for transmit control.. The Sound card
is connected to the FT897 via the rear data jack. When i get around to
it, I'll build a serial port->data jack PTT adapter so I don't have to
mess with 'DIG' and 'PKT' modes, but for now it works well enough..
> If you are using the Mic in then you need to be in SSB mode and if the data socket on the back then digi mode. When you are transmitting is your output power meter showing a reading? Check the data coming into the 897 is sufficient to drive the rig if there is no power reading. You may need to connect a dummy load to investigate.
grin dummy load is on order (though I just confirmed everything with
an old-school light globe, that one kinda blew me away.. till it blew ;)
), but I have the levels setup correct for ALC etc, using K7AGE's PSK31
Level Adjustment youtube vid, so should be all good there..
> As to a local station (5km) you may have difficulty as you will be on groundwave. Depends on your output power.
So I found when driving around this morning, using 3G+VNC to
remote-control the home rig.. Don't know if it was distance, or the
saltwater lakes between suburbs here on the coast, but it was almost as
soon as I crossed a bridge, I'd lose the signal from home on the 857 in
the car

Thanks, I'm listening to myself on an Icom PCR1000 i picked up on ebay a
few months ago - very quiet receiver compared to the 897, but does a
good job for listening to myself ;)

> Watch the spotter sites like www.pskreporter.info when you're transmitting
> digital. Even if nobody responds to you, there are enough listeners that
> you're likely to get spotted.
grin I didn't know about that site! Cheers, seems I was last spotted
105 days ago, so I'm thinking antenna setup may be the issue.. - might
be worth digging one of my TNC's out of a box, and seeing if I can still
hit one of the local HF APRS digis - would give a good indication of
whether my antenna changes in the last year have totally messed me up ;)

On 10/11/2010 1:14 AM, JP wrote:
> To help you better, we need to know more about your setup, including what you're using for a tuner (the Tet-Emtron site says that the TEV-1 needs a tuner), how you have the antenna mounted, how you have the antenna grounded (or a counterpoise). Also, we need to confirm that you have the antenna into the correct antenna jack in the back and that you're in the correct mode for the band you're using. Please also include your menu settings for anything related to digital or phone, including things like digital gain (menu 037), digital mode (menu 038), digital shift (menu 039), digital vox if you're using vox (menu 040), dsp settings (menus 045 thru 049), mic select (menu 059), SSB mic gain (menu 081), vox gain if you're using vox (menu 088).
I'm thinking antenna might be the problem here.. - back when i first
pulled everything out of storage and setup, I was in the back garden
shed (and then relocated out of there when summer hit and it was 45C in
there..), so the TEV-1 was sitting smack on the roof of the shed.. My
first transmit was 30m APRS, and my first packet out hit both the VK2TV
digi 400km up the coast, and the VK5RLY digi over in adelaide. Though
after I relocated to the garage, the antenna instead went on top of ~5m
of mast, with three (grounded) guy wires hung from directly below the
antenna.

And then ~3 months ago, I spotted a rotator cheap on ebay while I was on
holiday down south, so ended up replacing my very sloppy mast with a
much stronger 6m gal pipe, rotator on top, and then 1m of pipe on top of
that. Guys are about 5m of the way up, so ~2.5m below the antenna. The
shop I bought the TEV-1 from originally told me that the antenna doesn't
require radials - but then they also told me it *HAD* to have a 4:1
balun, which caused me no end of grief when I first installed it.. -
pulling the balun out and terminating the coax direct to the antenna was
the best move I ever made..

Shoving a SWR meter in between the radio and the AT897, I'm seeing about
1.5:1 - Is that 'normal' for a tuner? Or is that an indication that even
with the 'ugly balun' cleaning up the RF on the feedline, the antenna is
still horrid for 40m?

I'm thinking this latest move is probably what's messed me up? Since
I'd like to pop a HF beam up there (as well as the 2.4Ghz dish I'm
playing with at the moment..), I can't really move the guys to directly
below the vertical - so I'm thinking of either moving it back to the
roof of the shed (it's original position) and running 20m of cable to
it, or throwing up another mast on the other side of the house, and
string up a 40m dipole.. Dipole is probably the 'easiest' option, it's
just a matter of getting it up while the missus is out ;)

Regards,

Damien

Hi Ian
The ft897 has two sockets on the back one is a data socket for tones in and out. the other is the cat/linear socket this for control of the programming of the radio and adding a linear amplifier.
Also the interface cable to do the programming is not a straight cable it has a small circuit board with in the 9 pin plug. this is to control levels entering the radio as high levels could damage the radio circuitry.
when i bought mine i bought this cable and have used it since.
the circuit with in the plug is modern surface mount components.
so unless you could acquire a circuit diagram to emulate it would be best to purchase one.
CT62 Cat interface cable ps2 plug, CT 39A packet cable CT58 Band data cable.
CT62 is the program cable the CT 58 is for another purpose.

Dear Randy:

This is my late reply but could you advice exactly how can I get a counterpoise for UHV-5 as base use? the SWR is incredibly high-5.0 on 50.110 mhz I wonder what went wrong, the grounding? because I set up this antenna at the top floor against the cement side wall with a simple antenna mount and a 10 meter long 8D coax to the Ft-897, no grounding(which is greek to me)...the counterpoise you were referring to means the radial? I am ordering a tuner, does that help?? Thanks and 73s

31707. RE: [FT897] Hat cable to use for programming the memory

Yahoo group: FT897 (2010)
Date: 2010-11-11 11:13:04 UTC
From: Eric van de Weyer
Topic: 31696 Message: 31707

HI Ian,

If you search on eBay for CAT Cable, you'll come up with heaps of them at very reasonable prices. I have a couple of the USB ones which I use with my netbook.

Alternatively, if you do the same search on Google, you'll come up with quite a number of circuits. I have previously built one which used a couple of transistors and a few other components and connects to a serial port and it worked great too.

For the programming I use FTBasicMMO which is a great little program. You can download it and it think it cost $25 to register it. I use it for my 897, 857's and 817 and it is a great little program. Just Google the name to find the author's site.

Actually had a situation with the 857 in my car the other day where I ended up having to do a full reset as it had lost sensitivity and I could hardly hear anything. All fine after the reset and I just reloaded the memories from the netbook.

73....Eric VK2VE.

Subject: [FT897] Hat cable to use for programming the memory

Hello,

I would like to program the memory of my FT897D from my PC and need a cable. I'm assuming that I need a cable that connects to the data port and not the CAT port, is this assumption correct? Looking on the internet there seems to be serial and usb cables, what would be the recommended one or are they as good as each other? I'd also like to try out PSK31, can I use the same cable or is there a different approach?

Ian

From: Steve Yates
Topic: 31678 Message: 31708

Damien,

Your power meter is designed to read power in a 50 Ohm system. The power meter must go between the rig and the ATU.

If you let the ATU tune the mismatched antenna system and then put the meter with its short coax AFTER the ATU you may change the impedance to the ATU and the SWR at the rig will change like you are seeing. This is because the impedance at the end of a mismatched coax will change with its length and your ATU will have to retune to provide a good match to the radio. Of course you may just have something wrong with your meter.

The ATU will provide a 50 Ohm match to the radio but it does nothing for the mismatch between the antenna and the coax feeding it. As long as the coax has low loss the begin with sometimes you can get by doing this without much additional loss. It is always best to place an ATU at the antenna or tune the antenna so that it provides a good match to the coax. Tuning the coax, especially with electrically small, hi-Q antennas will lead to poor performance.

I'd like to throw in here too that The ARRL Handbook is worth its weight in gold to a ham. Even if you can only find an old one in a library it is worth it. It really helped me when I was a young ham.

73,
Steve - AA5TB

Hi Tom,

The first thing I would try is the CAT cable if it was connected to the previous radio. The electronics in it may also be fried.

The next thing would be the serial port of the computer.

73....Eric VK2VE.

Iain,

The default squelch settings are stored in the Service Menu, number 013 through 016 I believe. Don't mess with them unless you have to. On VHF my squelch setting was a little loose so I did.

From: Steve Yates
Topic: 31713 Message: 31717

Robert,

The S-meter is driven by the AGC voltage as is the case with most rigs. If you turn off the AGC you turn off the S-meter. The RF Gain controls applies an AGC voltage to control the receiver gain. Turn the RF Gain down (CCW) and the S-meter goes up. Essentially signals below the S-meter reading will be in a linear region and not compressed to a constant output. This is why turning the RF Gain control back sometimes releaves listener fatigue and restores the "dynamic range" of the signals you are receiving.

Some rigs simply use a variable front-end attenuator for an RF Gain control and the S-meter simply shows less signal when you turn the gain down.

31720. HT Antennas and SWR

Yahoo group: FT897 (2010)
Date: 2010-11-15 23:24:11 UTC
From: scotchmandr
Topic: 31720 Message: 31720

OK, it is bad enough that the Rubber duck which came with my 817 always gave bad SWR readings on the 817's "meter". It was also missing the large tip and so I ordered a new set to get the tip. Now I have the tip and 2 bases. The second base has worse SWR then the first.

I tried these antennas on an 897 and got bad SWR. ESPECIALLY on 70cm. I have the 897 set to 5W and tried a number of HT antennas. All showed 2.0 or worse. Some showed 3. On 446, all of them showed horrendous SWR and sent the 897 in HSWR mode (they all did this on the 817 as well).

These are supposedly namebrand (TIC) 2m/70cm dual band HT antennas. I would expect at least 2.0 for both bands. The people in my club say "dont worry", as if HT's and Mobiles dont bother with SWR.

I have used these antennas on my HTs and one on my Mobile for a long time. I never worried because none of these radios ever displayed an SWR and they worked at least 'good enough'.

I tested them on an MFJ 259 and though it displays a "slightly" lower SWR... They all still show high results.

So, is if going to be harder to find a portable antenna that the 897 "likes".

Do we really not worry about antennas on HTs or Mobiles?

I am only testing with 5Watts on the 897 and 10W on the Mobile (into an antenna whip rated for 20W).

So I am not being aggressive here but very cautious. Having just got my 817 back from Cal for finally blowing its finals after 8 years (one of the early models prone to this; yet mine took 8 years).

Now I am SWR paranoid! Should I be?

Why have an HSWR on the 897 if it is not useful?

ALWAYS be concerned about SWR. Bad SWR will kill any transmitter. I have gotten good results using the Arrow dual band J-Pole, one mounted to a wooden handrail about 15 ft in the air and another one mounted on a tripod that can only get the base of the antenna about six feet off the ground. The only problem that I've experienced was if the "backside" of the antenna (driven element) is pointed at our steel garage or even the rain gutter of the house when using the tripod mount, I experienced multipathing. Rubber ducks (portable dummy loads) are almost always terrible. An alternative to using the Arrow dualband is to make a J-Pole out of 300 ohm TV twin lead. Plans are all over the internet. I've even put one inside of PVC pipe and duct taped it to a chimney. Make one for your backpack and carry some small nylon rope to attach to the top end and suspend it high up in a tree.

I have a Comet M-24M dual band on my car for use with my 8900 as my Car-Port clearance is only 20". I have been using it since June and enjoyed it.

But tonight, I tested my 897 with it and although it was "acceptable on 2m, When I switched to 70cm I got wild and mostly horrendous results. Especially when the ARS goes 5Mhz one way or the other depending upon the repeater.

How close of SWR reading is normal or acceptable on mobile whips for 2m and 70cm. I never worried about this before because I never had a radio "yell back" at me!

For HF I have the AT-897 and a Buddystick. It is 2m and 70cm that I am working on now.

And if all our Hts have such bad SWR on our ducks, why are we not bothering about it? Ignorance WAS bliss!

31725. Glitch leaves my FT-897 with low output on 160m

Yahoo group: FT897 (2010)
Date: 2010-11-16 05:25:17 UTC
From: Rob Stampfli
Topic: 31725 Message: 31725

Gee. Just when I was beginning to really enjoy this rig, it comes back and bites me. Let me post the particulars here to see if anyone has any suggestions before the rig goes back to Yaesu.

I participated in the CQ-WE contest this weekend, and gave the rig a fairly hard workout in the process -- lots of different bands and a few cockpit errors. It performed flawlessly right up to the end of the contest. Immediately after making my final contact, I hurriedly powered the rig off from its front panel button and left to meet some friends for dinner.

Upon returning to the shack a couple hours later, I noticed I had not removed the power from the rig's internal PS, something I normally do. I didn't think anything of this, but when I powered the rig back on from the front panel, it immediately did a complete master reset, something it had never done before. Hmm. Further investigation revealed that the rig is now only putting out about 40W on the 160m band. It seems to put out 85W or better on all the other HF bands, which seems a bit lower than before but at least in the right ballpark. On-the-air tests reveal no audio distortion at the 40W level on 160m.

I removed all the ancillary cabling and tried another full master reset, but no joy. Power Control behaves normally up to the 40W level. Then, ALC drops to zero, but the power out sticks at 40W (on 160m). The only other anomaly I see is that the "13.8V" indicator on the display, which always used to read 13.8 or 13.7 on receive, is now reading 13.6 or even 13.5V. The measured the no load voltage on the PS is 13.9V.

Believing perhaps the service menus had been corrupted, I went into alignment mode and found 18:HF1-IC and 24:HF1-MAX appeared to be set to reasonable values. I tried adjusting them but to no avail. 17:VCC reads 138.

Without breaking open the case, something I am reluctant to do, I'm out of ideas. Any suggestions?

Rob / KD8WK

removed the power from the rig's internal PS, something I normally do.

I didn't think anything of this, but when I powered the rig back on from

the front panel, it immediately did a complete master reset, something

it had never done before. Hmm. Further investigation revealed that

the rig is now only putting out about 40W on the 160m band. It seems

to put out 85W or better on all the other HF bands, which seems a bit

lower than before but at least in the right ballpark. On-the-air tests

reveal no audio distortion at the 40W level on 160m.

I removed all the ancillary cabling and tried another full master reset,

but no joy. Power Control behaves normally up to the 40W level. Then, ALC drops to zero, but the power out sticks at 40W (on 160m). The only other anomaly I see is that the "13.8V" indicator on the display, which always used to read 13.8 or 13.7 on receive, is now reading 13.6 or even 13.5V. The measured the no load voltage on the PS is 13.9V.

Believing perhaps the service menus had been corrupted, I went into alignment mode and found 18:HF1-IC and 24:HF1-MAX appeared to be set to reasonable values. I tried adjusting them but to no avail. 17:VCC reads 138.

Without breaking open the case, something I am reluctant to do, I'm out of ideas. Any suggestions?

Rob / KD8WK

Topic: 31727 Message: 31727

Hi Guys
i have seen a lot of problems mentioned, without much detail about power supplies and details about having checked certain topics such as temperature of the case.
some vswr bridges are sometimes so inaccurate.sometimes issues get missed in the heat of the moment.
this method used allows for no question asking with resposive replies when an operator admits he has made a mistake.
what we used to call a customer operating error.
i have made many in my thirty years and many with this radio, as it just has a few nasty little things it does for no apparent reason like switching off the AGC so you get no S meter reading it seemed to affect the squelch as well at the same time.
Maybe it has a few software faults and the only cure does seem to be a hard reset. pain that this might be as you then need to reload the parameters you have put in over several months.
like the RF power level was it rather warm at the time or maybe just hot. Regards Robert G6LLP

Hi Phillip,

Have you thought to check your leads and connectors between the various parts, and as you will no doubt be using at least one PL 259/SO 239 combination, check that they are not of poor quality. I would also try differing length cables if you have them to hand. I know that I will be starting a flame here, but the PL 259 type connector isn't exactly rated for much above DC, let alone 70cm.

It's been quite a while and my problem seems to have been solved. I used a wrap-around toroid on my ground wire. Have had zero troubles since.

It seems that Paul was correct that the FT-897D is a little sensitive.

Thanks for your help Paul.

Phillip-
It's hard to determine what you're complaining about- High SWR? Can't receive any signals? With transmission you're not heard by anyone? Also, it's unclear about your level of expertise and training- Do you have an amateur radio license? What class? When licensed? Are you trying to mount the vhf/uhf antenna directly on the back of the FT-897? Are you using the correct antenna jack? On vhf and uhf, are you trying to operate through a repeater and do you have the correct frequencies and CTCSS tones stored in memory channels? Or are you operating simplex?
Comments like ". . . HF is ok, VHF borderline, and UHF stinks. . . ." don't convey much information.

I have tried with various whips and the mobile antenna on the car's Mag-mount. With 18' coax as well as straight to the back of the radio with a bnc-uhf adapter. All these combinations have one thing in common, HF is ok, VHF borderline, and UHF stinks.

I have a 2m/70cm whip on the bnc of my 817 and never had a problem like this. Is there a design difference with the 897?

I am basically trying to apply the same antennas and setup that was successful with the 817, onto the 897. I DO have the 897 turned down to 5W-10W as appropriate to the antennas used.

At 5-10 watts the 897 cant really turn the power down much haha!

As this problem is consistent with all antenna combinations with or without any coax, I suspect something inside the radio. Either physical or a soft-menu item. And that is what I am trying to narrow down.

I wish someone on this list lived in the Detroit Michigan and was good at radio repairs. I really am trying to delay shipping it off to Texas!

Hi Rob
In my 50+ years in electronics and 30 years as a radio amateur switch mode power is fine when the switch mode has as much metal weight as a linear power supply.
the reasoning is the smoothing when the power has been converted.
a lot of these modern cheap switch mode units can cause untold damage to the electronics that follow them.
when transmitting on FM the carrier is constant so the switchmode stays at a constant frequency. but when used with a set using double side band and single side band the frequency in the cheap switch modes changes and does introduce much noise into the radio and on to boththe incoming signal and transmitted signals.
A linear or a large sealed lead acid battery is a far better option. Regards Robert G6LLP

I've been running the internal switching PSU on the FT897 for some years now with no problems whatsoever and no obvious injected noise either for tx or rx.
A lot of modern switchers are actually fixed frequency but variable duty cycle.

Almost all modern PSU designs are switcher based, they are generally lightweight as since the switching frequency is high the need for large transformers and bulky smoothing caps is eliminated. You do still need some bulk decoupling caps of course.

Both my IC7700 and Quadra linear use high power switch mode PSUs, the Quadra power supply produces some 2.5kW.

With careful design and suitable crowbar protection I can't see how any damage can be caused to the following electronics.
Ironically the only PSU damage I have had is when first licensed as a G8 in the 1970s. The series pass transistor let go on my homebrew linear PSU. I added crowbar protection to make sure that didn't happen again!

Thanks Sean,

That is helpful, so I should expect to see the same type of results that I do with my 817. At least that is what you are getting. And it makes me suspect the radio now. I get Low SWR with the antennas, DL, and coax with my 817 and the 259 Analyzer on VHF frequencies.

The Analyzer does not do UHF unfortunately. But all my 2m tests show good results with the 817 and the analyzer, while the 897 shows 2:1 on antennas that give 1:1 with the 817 and 259.

The 817 gives me No-Bars with my Mobile setup on VHF & UHF but the 897 (plugged into the same coax and connectors) gives 2.2:1 SWR on VHF and >8:1 on UHF into the exact same setup!

I am wondering about the SO-239 V/U connector in the 897 itself?

I am wondering about the SO-239 connector in the 897 itself?

Someone said the following on 11/17/2010 00:35:
> Hello, Phillip...
>
> Sorry to hear about your troubles. I really hate it when things like that happen. I use my 897 *mostly* for HF work, but I do use it once in awhile on VHF/UHF. Right now I have a Miracle Whip attached to the VHF/UHF antenna connector. Unfortunately, I don't have a real SWR meter, so I just use the FT-897's built-in one. I decided to run some tests at different power levels so we could compare readings. To perfrom this test, I used an MFJ-260C dry dummy load. I tuned to the frequency specified below and keyed the mic for 5 seconds with the 897's meter set to SWR. I then repeated three times at each power level specified below. Here are my results:
>
> 146.520 MHz
>
> 5W FM - 0.5 bars
> 10W FM - 1.0 bars
> 25W FM - 1.1 bars
> 50W FM - 1.5 bars
>
> 446.000 MHz
>
> 2W FM - 0 bars
> 5W FM - 0 bars

> 10W FM - 0.1 bars
> 20W FM - 0.1 bars
>
> So the interesting thing I see in these tests is a lower SWR at UHF than at VHF. Either way into a dummy load, it is pretty low.
>
> One thing I do wonder is this... If you take the same VHF setup you have and hook your antenna analyzer up to it, what sort of readings do you get? I'm thinking that if you hook up the analyzer to the VHF setup and see a high SWR, or it says the antenna is tuned for a different frequency, that might point the finger at your coax or a bad connector.
>
> So if it is possible, maybe you can hook the dummy load up to your antenna analyzer and see what it says about SWR, then hook it up to the radio to see if they agree? You could also try the same thing with the 2m mobile antenna you have.
>
> I am hoping it's some bad coax or something like that.
>
> Anyway, I hope that works out for you. Keep me posted. Good luck.
>

Phillip

I am a little consused as to what your test set up is exactly?

I understand that you are using a Diamond dummy load, but how are you measuring the SWR with the 897? Your readings such as 2.2:1 and 8:1 cannot come from the 897's VSWR display as that only shows blocks and is effectivley uncalibrated, so what are you using to measure the SWR with?

When you swap between the 897 and the 817 are you using EXACTLY the same cables or are you using a patch lead or adaptor thet is not required with the 817?

73
Jeff

Phillip

I am a little consused as to what your test set up is exactly?

I understand that you are using a Diamond dummy load, but how are you measuring the SWR with the 897? Your readings such as 2.2:1 and 8:1 cannot come from the 897's VSWR display as that only shows blocks and is effectivley uncalibrated, so what are you using to measure the SWR with?

When you swap between the 897 and the 817 are you using EXACTLY the same cables or are you using a patch lead or adaptor thet is not required with the 817?

73

Jeff

OK, thanks Jeff and I will happily give any more info as I want to understand this as well. Most of this was answered in earlier posts but I will line it up here:

I am using an LDG External FT-Meter to give me my numbers readings. I believe though, that is is the same calibration as the internal meter and thus, if the internal meter is "off" then so will this. But the FTM is why I give numbers and not just bars.

I calibrated the FTM according to the LDG manual. But if the internal metering is off so would this. I do not have an external SWR meter for VHF/UHF and so I am going to ask around.

I did one test for example; on my mobile setup. A magmount with a UHF to BNC adapter on the end of the coax (I already hear the boo-ing croud - get over it OMs; not everyone has your luxuries).... I imply plug in the 817 and work repeaters. The 817 shows no SWR bars and full power out on VHF AND UHF (all 5 watts of them haha). I swap for the 897 (same antenna and coax) and leave the UHF 90 degree bend and the UHF to BNC adapter - suddenly the SWR goes up when I TX. I remove the adapters and now the SWR os Flat all across VHF but UHF is still >3. The 817, I leave the BNC adapter on the coax and plug it into the 817 front antenna port and get a flat no-bars SWR on both VHF and UHF at 5W full Power Out.

NOW, Thanks to everyone's hints (hihi) I plugged the Dummy Load to the V/U Ant port directly (no adapters) and get flat 1:1 SWR on VHF and UHF. BUT AS SOON AS I ad ANY adapters, coax, antennas, etc; the SWR goes up! (And for the guy who did not know if I meant TX or on RX - I never got SWR readings on RX so please DONT PICK FIGHTS! I wanted help... If you want to debate, then email me and bring your Bible along....

So, STEP ONE I need to verify my readings with an external V/U SWR meter in-line with the Coax in my Mobile setup and see if I get different readings from the internal (they would have to be a LOT different).

QUESTIONS:

*** Can the internal SWR metering become "uncalibrated"?

*** Can RF be traveling back in through the Adapters and the coax?

Is this a False SWR reading then? And is this bad, other than the Obvious fact that I need to know if I am getting true readings?

Can the internal SWR "relativity meter" be recalibrated easily and how do I reduce RF coming back INTO the radio from OUTSIDE the Antenna IF that is happening?

I never had ANY of this with my 817. That rig is as Plug 'n' Play as they get. And is my perfect QRP rig when I strap my Z817 ATU to it for HF. I have talked to TX and AL using nothing but a whip on it, so no more "Bad Antenna setup by an ignoramous". You don't need to like QRP and just because you are rich enough.... If you dont like my setup then donate something that will help (seriously, anyone got a VHF/UHF SWR meter to donate?)

Would running a jumper from the outside of the coax connector to the Radio Ground screw, help?

I can run my 817 both mobile, base or portable; I thought that I SHOULD be able to do the same. I stick a whip on the BNC of the 817 and use it as my backup Repeater Radio. NO SWR problems. No feddback of any kind, not at 5 watts. I was expecting that the 897 could be run similarly if needed, butt AT LEAST it should be able to be swapped for my 1900 or 817 in the van without changing Antenna or Coax. I even used the MFJ259 to find a better placement for the Magmount. I have gotten the SWR down to 1.3:1. The Van makes a really big ground-plane compared to the Focus ;-)

So have I provided enough details. At 5 watts I have never had coax, adapters, or any other connections pose a problem on VHF or UHF. Only a bad 6M whip one time...

At least, with the dummy load showing 1.1 when attatched without any adapters suggests that the radio is at least, mostly OK! Unless the SWR meter can become "uncalibrated" within the radio. Or unless there is a bad lack of grounding somewhere?

Agreed if the internal calibration is off then the LGD will be off a swell, BUT even when operating correctly the readings will not be that accurate unless you can accurately measure the forward and reverse powers and the use those figures to calibrate the LDG meter (which you can't).

> I calibrated the FTM according to the LDG manual. But if the internal metering is off so would this. I do not have an external SWR meter for VHF/UHF and so I am going to ask around.

I think that it is vital that you get/borrow an accurate external VSWR meter, as there is something strange going on here.

>
> I did one test for example; on my mobile setup. A magmount with a UHF to BNC adapter on the end of the coax. I imply plug in the 817 and work repeaters. The 817 shows no SWR bars and full power out on VHF AND UHF . I swap for the 897 (same antenna and coax) and leave the UHF 90 degree bend and the UHF to BNC adapter - suddenly the SWR goes up when I TX.

Confused here,I assume that the bnc is on the antenna cable and you are using the UHF port on the 817 via an adaptor?? Or is the UHF on the antenna cable, in which case how do you plug it into the 897 using a BNC adaptor??

>I remove the adapters and now the SWR os Flat all across VHF but UHF is still >3. The 817, I leave the BNC adapter on the coax and plug it into the 817 front antenna port and get a flat no-bars SWR on both VHF and UHF at 5W full Power Out.

> NOW, Thanks to everyone's hints (hihi) I plugged the Dummy Load to the V/U Ant port directly (no adapters) and get flat 1:1 SWR on VHF and UHF. BUT AS SOON AS I ad ANY adapters, coax, antennas, etc; the SWR goes up!

The fact that adding an adapter causes a problem would seem to indicate that there is a faulty cable or adapter somewheere in the system. Adapters have been known to be faulty/poor at UHF, and I would check that all of the connectors are sound, particularly the UHF ones which can danage the coax is overgeated when soldering.

> So, STEP ONE I need to verify my readings with an external V/U SWR meter in-line with the Coax in my Mobile setup and see if I get different readings from the internal (they would have to be a LOT different).
>

> QUESTIONS:
>
> *** Can the internal SWR metering become "uncalibrated"?

Yes if the hidden calibration settings are corrupted or tampered with, and of course there is the possibility of a hardware fault.

>
> *** Can RF be traveling back in through the Adapters and the coax?

Faulty coax or adaptors can cause these sorts of problems.

>
> Is this a False SWR reading then? And is this bad, other than the Obvious fact that I need to know if I am getting true readings?

You wont know unil you use an external VSWR meter and check all of you cables and adaptors.

>
> Can the internal SWR "relativity meter" be recalibrated easily and how do I reduce RF coming back INTO the radio from OUTSIDE the Antenna IF that is happening?

It can be calibrated by following the calibration in the service manual, BUT I would not recommend trying it unless you are totally sure of what you are doing, you can seriously upset your radio!!!

As far as rf getting back to the radio that will not be the case when using a dummy load (as long as your coax is good)

>
> Would running a jumper from the outside of the coax connector to the Radio Ground screw, help?

No, and if it has any effect at all when using a dummy load then you coax is duff.

If you are reworking the unit for CF1005, you might want put the fix in located in files section: FT857-897_CF1005-fix.pdf
This AC couples the filter to protect it from long term failure.
Did it to my 897D and worked fine.

Hi all, I have some questions.
First I'm going to buy a FT897D for Xmas. We (my wife Mada, PA3GUX and I, PA3GUW) have planned a DX-pedition in 2012 for Uganda 5X1 while visiting a UCCF (Uganda Child Care Foundation) project.

The FT897D, a Buddipole and a netbook for Digimode and logging will be the equipment.

As the Buddipole is used as a " tuned" antenna using an antenna analyzer a FC30 or LDG tuner does not seem to be necesarry but please tell me if I'm wrong.

Transportation there would be a 4x4 (Landrover 110 or Toyota Landcruser) and for /M I would use the ATAS120 antenna, anyone having experience with this antenna on these type of car's (the Landrover is from Aluminium ... eg.) or should I take an Outbacker to the South part of Uganda.

Anyone have been there, experience with getting a temporary license (1 month)?

Thanks for reading and any suggestions are welcome!

Hi William

Be carefull with buddipole, you must adjust the antenna each time you change the band. Even with a coupler you must adjust length and coils of the buddipole. I have one and it's a nice antenna, funny too, not heavy and small in the bag.
If you buy a coupler ,buy a LDG YT-100, i have one also, and it works nice, but the most interesting is that this tuner have an CAT for the computer, instead of some other eg FC30 which have not this port and it's not possible to connect your netbook at the same time the coupler.
Not much used the buddipole but maybe it would be better to have a coupler, and a MFJ259 for your travel.

Phillip,

I didn't realize such a simple question as yours would start such a flame war...

In a later post, you stated using a UHF "elbow" adapter, I believe. If you have been using that same adapter with your dummy load and other tests, remove it from the equation and try again.

If that fixes the "problem", let me know and I'll explain my theory to you.

William,

You will need the antenna analyzer to tune your BuddiPole for each band, unless you already have the lengths figured out. The numbers that come with the kit are merely baseline figures. Also, proximity to structures (such as your SUV) may change the tuning.

Also, I've found that the BuddiPole's restricted height, when assembled, adversely affects the 40 meter band. Although you can resonate the antenna, the feedline impedance is far below 50 ohms. This will create an unacceptable SWR for your radio. Because of this, you have a couple of options:

1. Take your tuner along
2. Purchase an impedance transformer (from BuddiPole or other source)

Rob,

Have you tried an external power supply? Also, have you tried transmitting into a dummy load to insure an unhappy neighbor didn't pin your coax after a weekend of RFI (HI)?

Pardon me, but a toroid on your ground wire is like fusing the neutral lead on a power supply. You're just asking for trouble.

Although it may have initially helped your RFI, the increased inductance on your ground will be counterproductive for protection from nearby lightning strikes.

Just thought you'd like to know.

HI, HI!

About a year ago, I went to the local fair grounds to help our Amateur station operator. He was getting no signals from his 897D, not even static. He and another ham had checked his cables, antenna, switched antennas, etc, to no avail.

Within 10 seconds, I had the problem fixed. His RF gain was turned nearly all the way down. Yep, you're right, happens to the best of us at times.

Phillip,

Rubber Ducks are about the worst "antenna" out there. As others have said, there's not much reason worrying about them. Since they've been used on thousands of handheld radios for decades, they must be doing something (partly) right.

As for the SWR, keep in mind that a rubber duck has virtually no ground plane to work from when mounted on a "portable" radio. The only time you might measure a decent SWR is if you mount the duckie to a mag mount and place in on top of your vehicle. Other than that, all bets are off.

The portable radios I've been maintaining for the past 20+ years have a special matching network at the base of the rubber duckie. If you plug in an external antenna, this network is bypassed. Apparently, these antennas aren't rated a solid 50 ohms.

Since you're using such low power output, it's unlikely that you will damage the finals of an 897D. The main reasons for hardware failure is heat and high voltage, neither of which you will get when operating 5 watts into a rubber duck antenna.

Tnx Olivier,

Yes I know how the Buddipole works. I'm building an antenna analyser at this moment so this will easy working with this funny antenna.
I do not have a Yaesu tuner, I have a MFJ tuners somewhere in the shack and give it a try.

I will look to the LDG YT-100 later on.

Hi Randy,

I'm building an analyser at this moment ;-)

I also take a tuner with me to use a wire or dipole if neccesary.

TNX for your comment, I will keep this in mind.

31761. Re: [FT897] Re: Glitch leaves my FT-897 with low output on 160m

Yahoo group: FT897 (2010)
Date: 2010-11-17 20:19:06 UTC
From: Rob Stampfli
Topic: 31725 Message: 31761

Hi Randy,
Yes, I have conducted most of my experiments into a dummy load, although it behaves similarly with the antenna. (Obviously, the OTA tests were with a real antenna.) FWIW, the rig (and an external meter) is showing good SWR so I don't think that this is the problem.

I have not tried substituting an external power supply. I could probably do that easily enough, but the voltage indicator on the 897 indicates I have good voltage (although a few 1/10ths of a volt lower than it once read) and the display doesn't dim or exhibit any symptom like that. But, if I have the chance, I'll test it on my external supply.

The schematic shows the rig has 7 bandpass filters for the various HF bands. Personally, I suspect something along the lines such as one of the PIN diodes that control which one of these filters is in the picture has blown, but that's only a guess.

If anyone else can think of anything else to suggest, I'm all ears.

Thanks,
Rob / KD8WK

I've decided that, if I ever come into possession of a HandiTalky, I shall cast the Rubber Ducky as far as is possible from me. I shall then obtain an aluminum hard hat and install upon it a 1/4 wave groundplane antenna and attach it to the minitransceiver with about 6 feet of minicoax. I'm sure my signal will be enhanced by the improved antenna. I'll freely admit that my antenna plan was inspired by a photo taken at Dayton a couple of years ago. The photo showed a Ham with a 2 meter Hexbeam mounted on a hard hat. I prefer the omnidirectional groundplane antenna, since, not requiring rotation, it will save wear and tear on the neck.(G)

You don't need a tuner with the Buddipole since you'll use the analyzer to tune the antenna to a good SWR. It's not a bad thing to have an tuner anyway just to make that final adjustment or avoid having to re-adjust the Buddipole when you're moving up and down a band (avoid having to tiptoe through the lions late at night when changing frequency).

I second the recommendation to get what Buddipole calls the the TRSB (a selectable balun -- actually an unun) to make tuning easier.

Remember that the Buddipole in its horizontal position is a dipole that is less than 1/4 wavelength above ground. Any horizontal dipole that is less than 1/4 wave above ground is going to mostly warm the clouds (i.e., a high takeoff angle) which will reduce your ability to be heard by stations that are beyond about a 100-150 mile radius (say 150-250km). Consider using your Buddipole as a vertical with counterpoise or "L" configuration to get longer distances. Also, you might want to join the Buddipole group on Yahoo and download the instructions for the vertical dipole configuration. I've had great DX success with the Buddipole as a vertical dipole or in the "L" configuration -- routinely hitting deep into South America or Europe from the Northeast US using an FT-897 at 25 watts SSB or 20 watts PSK.

I've had a lot of experience running digimodes with netbook class computers. I find that many of them will lock up if you're running digital modes with only 1 Gig of memory (the standard for most netbooks sold) when using the computer's internal soundcard. Adding an extra 1 Gig of memory consistently solves the problem -- as does using a SignaLink as the interface. At any rate, you should do extensive testing of your netbook on digital mode before you start your trip.

Iain,

The simple answer (from the manual) is that when the knob is programmed to act as Squelch, it works as such in any mode. If programmed to act as RF Gain, FM mode uses a preset squelch setting (set by the factory).

We have been using a Chameleon all band whip for several months now for portable work and have had nothing but great results both on voice and digital.
Tuner is an LDG 897 Plus and we use four 4 ft masts for elevation though we've also just used antenna w/a camera tripod w/ok results.
No need to manually tune each band and the two of us (my YL is also a ham) set up the antenna in about 15 minutes.

Subject: [FT897] FT987D on the go

Hi all, I have some questions.
First I'm going to buy a FT897D for Xmas. We (my wife Mada, PA3GUX and I, PA3GUW) have planned a DX-pedition in 2012 for Uganda 5X1 while visiting a UCCF (Uganda Child Care Foundation) project.

The FT897D, a Buddipole and a netbook for Digimode and logging will be the equipment.

As the Buddipole is used as a " tuned" antenna using an antenna analyzer a FC30 or LDG tuner does not seem to be necesarry but please tell me if I'm wrong.

Transportation there would be a 4x4 (Landrover 110 or Toyota Landcruser) and for /M I would use the ATAS120 antenna, anyone having experience with this antenna on these type of car's (the Landrover is from Aluminium ... eg.) or should I take an Outbacker to the South part of Uganda.

Anyone have been there, experience with getting a temporary license (1 month)?

Thanks for reading and any suggestions are welcome!

Damien,

First of all lots of power is not really needed for PSK31. I had a similar experience as you when I first tried to get going on PSK31. I ended up having a fellow Ham who lived a few miles away and was successfully running PSK31 (and who knew what he was doing) help me out. We prearranged a time and frequency so he knew exactly when and where to look. And we were running 2M FM as well so he could call me by voice and tell me what to change. Bottom line I found out was to cut way back on Digital Gain (I have mine set at 20) right off the bat. If you set it much higher than that, you will distort the signal and it will not be able to be translated by others.

Rule of thumb is to reduce it until the meter drops to zero then raise it ever so slightly.

73,

Mike Ernst, AE8U

Subject: [FT897] HF range - Help :)

Hi Folks,

Sorry, I know this technically isn't the right place to ask this question, but I wasn't quite sure where I should be asking it :)

I've had my FT897 for many many years now.. it works GREAT in the car (though now replaced in the car with a permanently mounted FT857), with a whip for 30m aprs. And it *was* working fine a few years ago (I've moved around a bit since then) for APRS from the shack also.. Note: APRS is about all i've ever used it for..

Anyhow, I've been trying to use PSK31 (and for that matter even voice! - which is a rare occurance for me..) for about the last 12 months, without much success.. - I can hear folks fine, but except for one New Caledonian station about 3 years ago (so a previous shack+antenna layout), noone ever seems to hear me. I figured ok, that's HF for you.. But on sunday I was sitting there listening to folks doing PSK31 on 7035.15, and heard one station come in whooping out over S9. A quick callsign lookup tells me he's only 5km away. Here's my chance i thought, and replied to his CQ. And

proceeded to spend the next hour replying to his CQ's, without response.. I thought maybe I wasn't far enough afield for him to bother replying, so shot him a quick email - but no, he definitely hadn't heard me!

Now I'm assuming that he's probably pumping out a fair whack of power, as the 2m extendable whip on my PCR1000 couldn't hear him at all, though the 8.5m TEV-1 sitting on top of the 8m tower in the back yard was getting him on the FT897 at S9+.

So I guess my question is.. - is the 897 just REALLY sensitive, and so I'm hearing folks I don't have a hope of transmitting to? SHOULD I be heard by someone 10km away on 7mhz? I'd have thought at that range, if I can hear him, he's going to hear me.. I"m kinda wondering whether I have something setup wrong, whether it's in software or hardware, or if I'm just expecting more than I should be?

Any thoughts much appreciated :)

Hi Damien
Being on the other side of this globe, i hear this sad tale of woe a lot. looking at your string of tickets i guess you have some problems which might just be very basic.
In my 30 odd years of amateur radio have found some very simple and very irriating faults both in my equipment and others and find simple remedies like looking at just simple joints to be the cause.
we all have those moments when something seems in explainable, till we start tearing it all apart then it becomes so obvious. Best Regards Robert G6LLP

Peter,

OK – sorry to hear you are giving up on it. My experience has been that if while using HRD you get a “Blue Screen of Death” it is usually related to incorrect drivers for the USB-to-serial cable. If you get things like reboots on your PC or weird things in your rig it is usually RFI. If you get noise it is usually line noise and adding ferrites, better grounding, etc will usually fix it.

Anyway, good luck and 73.

Well, that was embarrassing. Sent it from my Droid and I missed the “t” so ferrites became ferries. (I hate those stupid little cell phone keyboards.)

Anyway, thanks for adding humor <big smile>

Normal stuff.

You can minimize the noise by making sure you connect at no higher than 9600 baud... which is plenty fast.

As a practical matter, I would recommend using an LDG tuner if you are going to be using more than one antenna (and feedlines) over multiple frequencies. I use my FT897D as a portable field rig quite a bit with 3 different antennae and feedlines (ATAS-25, G5RV, Alpha Delta DX-CC). While it tunes up with few changes on resonant frequencies (this is especially noticeable on the DX-CC with the 40 and 20 meter bands), I have had several occasions where the LDG made the difference between getting out a signal or just watching my SWR bounce way up.

The LDG fits nicely against the 897 case and really hasn't added a severe travel penalty. Plus, it is very battery friendly (which is something you might consider going portable).

I haven't tried the ATAS-120, but the most consistent advice for that antenna that I hear is to make certain that you have a good ground as described in its book o' rules.

Hope you have fun on your adventure!
73 and Best regards,
David

Hi David,

tnx fr reply. Well I considered the LDG, but also read something about a Y-100 from LDG. I will investigate. And is a good ground/counterpoise not always the big question....? :-)

Keep you posted all.

William.

In tracing down my SWR problem I came across the below post post.

My own measurements are as follows.

I get 3.3KOhms checking both ways on the HF connector
and
I get 46.4KOhms checking both ways on the VHF connector

Is this what they should be? Or am I heading in the right direction?

go to this website and check out this amazing ant. it can be used as a mobile, backpack, or base ant.

Hi David

At last a post bt some one who knows what to do as some of the ideas about antennas i have seen here are so obviously just rubbish. Regards Robert G6LLP

As a practical matter, I would recommend using an LDG tuner if you are going to be using more than one antenna (and feedlines) over multiple frequencies. I use my FT897D as a portable field rig quite a bit with 3 different antennae and feedlines (ATAS-25, G5RV, Alpha Delta DX-CC). While it tunes up with few changes on resonant frequencies (this is especially noticeable on the DX-CC with the 40 and 20 meter bands), I have had several occasions where the LDG made the difference between getting out a signal or just watching my SWR bounce way up.

The LDG fits nicely against the 897 case and really hasn't added a severe travel penalty. Plus, it is very battery friendly (which is something you might consider going portable).

I haven't tried the ATAS-120, but the most consistent advice for that antenna that I hear is to make certain that you have a good ground as described in its book o' rules.

Hope you have fun on your adventure!

73 and Best regards,

David

Hi D C resistance has no bearing on the VSWR as anteenas are a combination of negative ac reactance and positve ac reactance the negative reactance is a capcitive component and positive reactance is a inductive component and never the twain shall meet, conbine with a resistance but in what proportions can only be measured using a signal generator which can show the reactance at a particular frequency.
the only other instrument is a network analyser or similar.
With RF nothing taken as a DC reading will make any sense what so ever.

In tracing down my SWR problem I came across the below post post.

My own measurements are as follows.

I get 3.3KOhms checking both ways on the HF connector

and

I get 46.4KOhms checking both ways on the VHF connector

Is this what they should be? Or am I heading in the right direction?

From: ROBERT FAREY
Topic: 13232 Message: 31783

Hi D C resistance has no bearing on the VSWR as anteenas are a
combination of negative ac reactance and positve ac reactance the
negative reactance is a capcitive component and positive reactance is a
inductive component and never the twain shall meet, conbine with a
resistance but in what proportions can only be measured using a signal
generator which can show the reactance at a particular frequency.
the only other instrument is a network analyser or similar.
With RF nothing taken as a DC reading will make any sense what so ever.

In tracing down my SWR problem I came across the below post post.

My own measurements are as follows.

I get 3.3KOhms checking both ways on the HF connector

and

I get 46.4KOhms checking both ways on the VHF connector

Is this what they should be? Or am I heading in the right direction?

From: scotchmandr
Topic: 13232 Message: 31785

Basically this check was only to test if the physical circuit was (at least in this aspect) in keeping with the averages of other like radios. A blown resistor in the final circuit would have shown up with a very different DC reading, correct?

It was then suggested that I connect my MFJ259 to the VHF antenna port on the back and test it like a dummy load to see what I get in regards to impedance. That makes sense as an aditional next step, testing.

31786. Re: [FT897] Re: what resistance at HF antenna connector should I measure?

Yahoo group: FT897 (2010)
Date: 2010-11-19 15:03:22 UTC
From: ROBERT FAREY
Topic: 13232 Message: 31786

Hi the problem with resistances with Rf cables they can be extremely mis leading having spent most of my working life testing RF radio cables, land lines and radios signalling systems.
 Dc resistance tests are generally only good to be honest for one thing dc siganlling systems. even that is very limited if it was a telegraph circuit as line signalling reversals did show up as distortion which gave an indication of water logged joints.
so one has little faith in dc measurements especially if it is to be used for RF signals.

From: ROBERT FAREY
Topic: 13232 Message: 31788

Hi Phillip
having commented on the subject of testing i have left out one item which is often not mentioned when testing cables it's called siemens it is a small component of a cable what actually is leakance this little known parameter causes just so much grief as it means you are loosing current be it small but it is present and our coaxial cable that we use do suffer from it when they get water in them.
it is a product of VSWR readings which unless you deal with RF and transmission systems in a professional field you would not encounter..it gives some problems which manafests itself in blown output stages.....Regards RF G6LLP

Basically this check was only to test if the physical circuit was (at least in this aspect) in keeping with the averages of other like radios. A blown resistor in the final circuit would have shown up with a very different DC reading, correct?

It was then suggested that I connect my MFJ259 to the VHF antenna port on the back and test it like a dummy load to see what I get in regards to impedance. That makes sense as an aditional next step, testing.

31789. Re: [FT897] Testing Impedance at VHF antenna connector. Should I measure?

Yahoo group: FT897 (2010)
Date: 2010-11-19 15:25:17 UTC
From: ROBERT FAREY
Topic: 13232 Message: 31789

Hi phillip
the MFJ analyser really will tell you nothing about the transciever by connecting to it.
even on it's lowest output i have found it puts out a mininmum of 7 watts which will over load the MFJ which has a maximum limit of 5 watts.
so i would prefer not to do this, and for what purpose.
the radio connected to an vswr bridge and then to a Large dummy load should be the best way to test the output.
in the first incident a metre of cable or less between each will show the best results.

that would be a bench test before connecting it to the long run out to athe base of a mast where the antenna is mounted to check out the cable using the radio to find out the loss of the coaxial cable to that point. this would require teh help of a friend.
if even just to key the mike on a Fm signal. Regards RF G6LLP

OK I will ask again,

It was then suggested that I connect my MFJ259 to the VHF antenna port on the back and test it like a dummy load to see what I get in regards to impedance. That makes sense as an additional next step, testing.

That's the one we use; we've only used it on HF w/the 9:1 balun, great DX and Portable results.
I have pix of it on QRZ.com under my call sign.

You could of course get/make a 9:1 unun and a 7m length of wire & 10m counterpoise for similar /p version.

> it is a product of VSWR readings which unless you deal with RF and transmission systems in a professional field you would not encounter..it gives some problems which manafests itself in blown output stages.....Regards RF G6LLP

I am sorry but that makes no sense whatsoever!!!

The Siemens is a UNIT of addmittance or conductance, and is merely 1/resistance or 1/impedance. It is the same as a Mho in old parlance, or 1/ohms. It is nothing to do with the product of VSWR readings. It only exists as a mathematical nicety, as it makes some calculations easier.

As far as connecting the analyser to the radio, I don't think that this will show anything, particulatly if off or in Rx, because of the switching paths involved.

The best way ahead has been suggested by several people, get an external VSWR meter and isolate where the problem actually lies. Even if it is a fault in the radio it is unlikely that it is a fault in the connector, more likely in the software set up or the reverse power detector. However,the fact that things are ok when you connect directly to the dummy load suggests that is it a problem external to the radio.

Hi Phillip

The test you are proposing won't help at all. At the very best you'll only be testing the receiver match to 50R and that won't give you any indication whatsoever as to the state of health of the transmitter.

Assuming the receiver is working normally then the physical connector and rx switching path can be assumed to be working, if not then look at that part first.
To debug the transmitter path you need to terminate the radio in a dummy load with a power meter in circuit and trace through the transmitter circuit. Do this on low power to start with. You can use a scope and/or a multimeter to do this. At some point the transmitted signal will either fail to be amplified or will disappear completely. You can then examine the relevant stage. It maybe that the TX/RX switching circuit is faulty. The usual method to sorting out this kind of issue is to be able to connect a suitable load between the stages as necessary to check that power is being developed (disconnect the following stage first of course). Having identified the failing stage remove it if necessary and test. Check and test all the associated components.
Quite often it becomes obvious as you debug where the fault lies, a burnt resistor or choke for instance, sometimes a capacitor will go short circuit.

If you've not done any fault finding before then you need to enlist the help of a competent local before you wade in. Bear in mind also that these modern radios are full of surface mount parts so the earlier stages will be difficult to see/work on. That having been said it's highly likely that the fault will be in the later, conventional component, stages.
I've had the FT897 apart a few times to carry out modifications and it's relatively straightforward to get at.

Good luck and a steady hand.

Cliff, G4PZK

Subject: [FT897] Re: Testing Impedance at VHF antenna connector. Should I measure?

Thank you robert;

but oh no no no thats not what I meant.

Radio OFF. Then connect the 259 to the 897 VHF Antenna port.

897 Radio OFF! turn on the 259 and check the impendance of the last network from the radio by testing the radio as a dummy load itself.

The idea being, that the Radio should show up as a 50 ohm load itself. If not, something is wrong with that final circuit.

That is what was suggested to me.

The only thing Transmitting here would be the MFJ259 with the 897 OFF and Unplugged.

I am not trying anything until I check with more experienced users on this group. But I have noticed some misunderstandings like the guy who thought I stuck my mag mounted mobile whip on the back of the radio.

Does the above make sense? I really want to check everything I can before shipping it off. May it is something simple to fix. And so far my local club all claim ignorance or just ignore!

I need an elmer here.... thank you for your patience

Phillip

Phillip,

I wouls srongly suggest that you do NOT connect the MFJ-269 to the VHF port on the back of your FT-897. You very well might damage the MFJ-269 in doing so.

73es,
Dick, W3GNQ

Subject: [FT897] Re: what resistance at HF antenna connector should I measure?

Basically this check was only to test if the physical circuit was (at least in this aspect) in keeping with the averages of other like radios. A blown resistor in the final circuit would have shown up with a very different DC reading, correct?

It was then suggested that I connect my MFJ259 to the VHF antenna port on the back and test it like a dummy load to see what I get in regards to impedance. That makes sense as an aditional next step, testing.

Phillip:

I agree with the others that connecting the 259 to the radio to see what the radio looks like to it is not going to get you anywhere, particularly with the radio off (for the reasons another person stated). The only way to know what's going on is to take an analytical approach to the problem. Unfortunately, I heard so much back and forth on this with people getting off track that I can't figure out what the real problem is anymore. It might help to tell us once again exactly what it is that you're trying to fix or determine.

If it was that you're seeing different SWR readings with one configuration or another. In general this comes from a small set of possible problems but the place to start is with a dummy load. If you see 1:1 into the dummy load and apparently inconsistent readings into other things, then there's only a small set of possible problems with your radio and beyond that the problem is outside the radio.

* The radio is generating spurious output on other than the dial frequencies for which the dummy load is a good load, but you're antennas are not.

* The reflected power sense in the radio is not properly calibrated or defective to cause it to read reflected power as being higher (or lower) than it's supposed to be. If this is the case you will see low SWR into a dummy load but other loads/antennas that are not 1:1 will show weird results. You can test this using known resistive loads to create a 2:1 or other known SWR and see if the radio is reading correctly.

I'm not sure there's much else that could be wrong with the radio in this case, unless there's some other problem that's bothering you. If you suspect the radio is problematic, the best thing is to find someone with some test equipment who can properly evaluate the radio before sending it in for repair.

Beyond this I'm not going to speculate without getting a better handle on exactly what you're seeing that's concerning you.

OK. My Current Setup involves an FT-817. I used 3 types of antennas. And let us not get sidetracked again because some people dont like my setup, I dont have a big enough property.

so, My 817 has the best Rubber duck I have , on the front BNC. I have a 90 degree angle UHF adapter and a UHF to BNC adapter on the back. to this I occassionally attach 3 foot of coax and a different HT whip that is about 16 1/2 inches. I use these two setups for VHF or UHF work and the 817 never complains more than about 1 bar on the meter (yes I know it is not accurate but that is a PRETTY GOOD MATCH.

HF on the 817 with either a miracle Whip or Buddy Stick is also not a problem...

Finally, I can take my 817 and swap it into the mag mount antenna on my Van that I use with an FT-1900. Again, the 817 gives maybe 1 bar on both UHF and VHF.

The MFJ259 tells me I have 1.2-1.5 on the Mobile setup depending upon band and is never worse.

So, my 817 and 1900 are "Happy".

HOWEVER, If I swap the 897 with the same angle bracket and BNC and coax etc. ALL attempts to use the 897 with ANY of the setups which work with the 817. ALL of them give me significantly higher SWR.

The Mobile setup on my Van goes from 1.2 SWR with the 817 to a 1.8 SWR for the 897.

BTW the 897 is turned down to 5 Watts both to even the comparison and for safety until this is resolved.

If I take the same rubber duck which gives a 1.5 on the 817, I get 2.5 on VHF with the 897.

These readings on the 897 are all VHF.

If I switch to VHF is is worse. The mobile setup and almost every other setup on the 897 is 1.8 SWR for VHF and minimum 2.5 SWR for UHF.

My 817 is very good with most close matches. Obviously I have a few antennas that are truly bad and the 817 will never use them. They have long since become "Classroom pointer sticks" for Maps and stuff.

but any antenna that works with the 817, I expent to at least be less than 2:1 SWR on the 897. I do not expect tthat same antenna to jump to >5.

I am having a bugger of a time getting anything that works for VHF or UHF on the 817 (I have two of them to test), to work as well on the 897.

EVERYTHING is worse on the 897. On VHF everything is about 0.5: SWR worse than it might be on the 817. And UHF is about 2.0 or more SWR worse.

YES, changing between connectors helps but never as good as I see on either 817.

I suspect something wrong on the 897.

I want to narrow down what it could be.

and I want to find out if I can fix it here or must pay and send it off. and since the Water bill arrived today, I now have more incentive to figure it out here ;-)!

Does that help, Chuck?

I will take your advice and keep asking around on the repeater for someone around who can help.

Phillip:

Yes, this helps. From what you describe, it appears that the FT-897 is operating properly except that the calibration of the reflected power / SWR readings are off, or at least different from the readings the 817 is giving you. Normally when these readings are off, they will be proportionately incorrect, which seems to be what you describe.

As I had mentioned, there's a way to tell if it's calibrated correctly that involves connecting different resistive loads to the antenna connector then seeing what the radio reports for SWR. The 897 SWR reading is calibrated by first putting a 100 Ohm load on it and telling the radio to set the correction for a 2:1 SWR, which it does automatically. Then a 150 Ohm load is attached and the radio corrects that to read 3:1. While you may not have these loads available, a 25 Ohm load should also show approximately 2:1 SWR and you can get that by attaching two 50 Ohm dummy loads together with a T connector then attaching that to the radio, assuming you have those.

Doing the above would be the only way to verify that you're 897 is or is not reading SWR correctly. I suppose it's possible, although from what you describe unlikely, that your other radios are all reading low. I don't recommend messing with the 897 setup values until you verify that. If you do verify that the 897 is wrong, you can either find someone local who has the necessary equipment to recalibrate it or send it in for repair.

A few last things to note. A small antenna such as a rubber duck antenna (or even a mag-mount antenna) attached directly to a radio will give different results based on the size of the radio, what's connected to it, and the things around it. The reason for this is that the antenna tuning is affected by the "counterpoise", which in the case of a rubber duck is the radio itself. (If the antenna is outside or better isolated from the radio, the readings should be the same.) Since things like rubber ducks won't be the same with an outboard SWR meter connected or the same as an antenna analyzer might show, the only way to know what the SWR is for a particular radio and frequency with a particular configuration of power supply, microphone, people etc, is to read the SWR off the radio. Of course if that's not accurate, you're not getting the right information.

Everything else should also be suspect whenever you have anomalous SWR readings. In particular, all connectors, adapters, cables, and such can at times be OK connected to one thing and not to something else. That can happen for a many reasons starting with different tension on

connectors and cables bending other ways. Even the antennas should be suspect as they can behave differently at different power levels if things aren't right. In your case with a variety of antennas, that doesn't seem to the the problem, but connectors may. Since your SWR is generally off by a proportional amount, it seems like it's only a calibration issue. If, however, things don't always look proportionally different between the radios, question everything else. For example, we've seen really bad connectors and adapters from some sources. One of the worst was a 90 deg coax adapter that had a spring in it for the center conductor!

Since you're in Oak Park, MI there should be a good number of Hams around with adequate test equipment to help you evaluate if the 897 SWR reading is in fact out of calibration and perhaps someone who can help recalibrate it. If you're going to be up in Petoskey some time soon I'd be glad to test if for you.

From: g8hul
Topic: 13232 Message: 31799

Philip

Have you considered that it may be your 817 that is faulty, and is giving optimistically good VSWR readings, and the 987 it perfectly OK??

The internal VSWR readings are very inaccuarte on both radios, so you MUST get an accurate external meter and find ot what is actually going on.

From: scotchmandr
Topic: 13232 Message: 31800

My 817 just came back from ham repair (Non-D model with the well known finals problem) and it is operating properly. I also have an 817ND model which gives the same consistant readings for my QRP usages. But the 817 was designed for qrp use into whips and other qrp compromises, the 897 was NOT.

What IS the problem (as you all have shown me) is that the 897 simply does not like compromised antennas, Dummy Load tests were all good but my antennas and coax are all the cheap kind. I just priced "amphenol" (sp?) connectors, not my budget today! And I dont own a big enough lot to even fit a 6m dipole, only a 1k sq ft house. This is an old neighborhood with very small lots and whip I operate QRP and whips.

So the 897 turns out to be overkill as a 5w radio. I may consider selling it for the $600 I paid for it + Shipping. Let someone else put it to use with a proper antenna.

From: dzrtram
Topic: 16351 Message: 31801

I've been a lurker for a long time, but I am now about to buy an 897. I went to the FAQs, but could not find info on what antenna to buy.

If you don't mind, please recommend an antenna for the 897. The antenna will be in a mountain valley in our fire department trailer (mobile home). We do have plenty of air space around the trailer, except for one huge tree.

Any help you can give me would be much appreciated.

Ross KI6HSI

Ross, what band or bands are you wanting to cover. As you are probably aware of, the FT897 is capable of covering both HF and VHF/UHF bands.

Phillip
dont even bother, its not going to tell you anything useful
the MFJ259 is for testing antennas NOT radios :)

If you want to test your transmitter ... feed it into a decent dummyload
Wattmeter
and see if you develop the correct power levels out on the relevent bands
plus/minus a few Watts

If you want to test the receiver ... feed a decent calibrated signal
generator into it
to test its sensitivity and see that it confirms to the data sheet for the
radio
on the relevent bands

31804. Re: Testing Impedance at VHF antenna connector. Should I measure?

Yahoo group: FT897 (2010)
Date: 2010-11-21 16:13:47 UTC
From: Steve Yates
Topic: 13232 Message: 31804

Does anybody else see the problem with the statement below? The FT-817 supposedly has a well known problem with the finals being blown yet FT-817s are believed to be designed for use with poorly matched antennas. Maybe not. Maybe the FT-897 just does a better job of telling you to stop that.

In any case use an external SWR to be sure and keep everything the same except the radio and see if anything changes. The only problem with this plan is that some of the antennas mentioned are using the radio itself as the other half of the antenna so things won't be the same. Then again maybe that's why you are seeing differences.

We can all speculate until the cows come home but I think Philip would do well to find an Elmer in his area to give him a hand. If we were close I'd be glad to help.

From: Steve Yates
Topic: 16351 Message: 31805

Ross,

You've asked a question that is impossible to answer. We need details of what you want to do. No one antenna can do all of the bands that the FT-897D covers, except for the old Heath Kit Cantenna, but it's performance was slightly below most antennas these days. At the very least you could string a wire to the big tree and use an autotuner such as the SGC SG-237 between it and a good ground system for all band operation from 160 m through 6 m. For 2 m and 70 cm maybe put up a commercial dual band vertical on a mast attached to the trailer.

If you have more specific frequencies ranges then the antennas can be chosen to optimize performance on those bands.

31806. Re: Testing Impedance at VHF antenna connector. Should I measure?

Yahoo group: FT897 (2010)
Date: 2010-11-21 16:57:20 UTC
From: Jim
Topic: 13232 Message: 31806

Philip,

Your 897 is a great rig for the money. I'd hang onto it.
There is an old saying about operating....
ANTENNA -ANTENNA-LOCATION-LOCATION.
Your station efficiency is dependent on it's antenna system.
In your case there is more options than you may think.

You mention a small house, does it have an attic?
A small loop antenna strung around the attic parameter
may work on some HF bands with an external TUNER.

A homemade 1/4 wave vhf or uhf vertical will fit in any room.
You can make a dualband copper j-pole also.

You mentioned a small yard, make a flagpole to display
our FLAG. The pole can be made from PVC, each section
stepping down in size until you reach the top. INSIDE the pvc
you can build a HF vertical with wire and/or coax. Bury as many
radials as you can. Zigzag them if you need too. You can attach them to
a metal fence, if you have one.

Is your house two stories? A vertical or inverted L shape
wire can be added to the outside.

Do you have raingutters? With a tuner you can possibly
load the gutters to work on HF as an antenna.

You will need to invest in a HF tuner. Get one with a built in SWR/WATT
meter. MFJ has many models and can be found on ebay for less.

For VHF/UHF there are a few cross needle meters made that are
very reasonably priced. The MFJ-842 is one of them.

31807. Re: [FT897] Antenna

Yahoo group: FT897 (2010)
Date: 2010-11-21 19:53:20 UTC
From: JP Douglas
Topic: 16351 Message: 31807

We've been hams for about a year now and have been learning mostly by trial and error.
Our motto is: throw it out there and see if it works! It usually does.
I made a G5RV Jr antenna, cost no more than $20 in materials.
It's supposed to do 40 to 10m, it's working on 80 as well, and SWR reads doable for 6m.
Not presently using it w/the 987 but with a Kenwood TS-120 we have set up in the basement.
It's up at about 32 ft and would be even better if I could get it up a bit higher.

Working on making an Off Centre Dipole that will do 80 to 10 as well, plan to use it as an inverted V.

Both these antennas do require a tuner, we've been through a few in just one year, started w/manual tuners and
eventually went for convenience of auto tuners. With the 897 we use the LDG AT-9897 Plus with great results.
With the Kenwood we use a Tokyo Hy-Power HC-200AT with also great results.

For portable work we use the Chameleon VI antenna, it does 80m to 6m as well as VHF if you take of the balun.

Whatever you do, keep the HF antennas away from the building!
We've had serious RF getting into the shack problems by having a vertical antenna (GAP Eagle) attached to the side of the house as well
as an Alpha Delta DX-B 1/4 wave Sloper under the GAP.
You can combat the RF with an RF Choke as well as an MFJ Artificial Ground, but best is to avoid it to begin with.

Last month we went to Lubec, ME for a few days of portable DXing, rented a waterfront cottage.
Set up the Chameleon next to the deck and had terrible results as well as blowing a circuit breaker every time we tried to transmit.
Moved the antenna 30 ft away from the house and had excellent results, both digitally and w/voice.

The OCD I'm building will eventually replace the GAP and the Sloper.

Best of luck!

31808. PK-232MBX muting FT-897D audio

Yahoo group: FT897 (2010)
Date: 2010-11-21 23:35:09 UTC
From: Hank
Topic: 31808 Message: 31808

I'm trying to get my AEA PK-232MBX working with my FT-897D. I have the computer talking to the TNC OK, and I'm working with Digital Desktop from CSS software. When I pull audio from the external speaker jack on the back of the rig, I see packet traffic in Digital Desktop. My problems are with using the data cable connected from the PK-232 to the data port of the 897.

Using the data cable, I can key the 897 but I can't connect to anyone. Also, when the PK-232 is powered on, it mutes the audio out of the 897. So if I switch over to 20 meters, I have to unplug the data cable from the back of the rig to be able to hear anything. Does anyone know what could be wrong? Any help is greatly appreciated.

Thanks for the reply Barry. I’m pretty new to this, but it seems like my problem might be a setting of some sort. Either that or the data cable I made is wrong. When I send data to the PK-232 through the audio input connector on the back of the 232, Digital Desktop seems to work just fine. When I use the data port, it doesn’t.

Thanks.

You may want to look at the MFJ 2990.. I wanted an all band antenna, I have this one. I put some hardware cloth on the ground below it for "ground screen". I use their radials, 32 of them. and 50ft coax and I have no problem going from 160 to 6 at all. You will need a seperate VHF/UHF antenna.

If 20/40 why not dioples cut for theses bands????

Thanks

Ken, yes I know the 897 gets 2m and 440, which we use. I think we'll be using 20-40 on the HF side. Thanks for any help you can be.

Remember, he said he was in a "mountain valley" and in a "Fire Department trailer". He's probably more interested in emergency communications than DX?
The MFJ Catalog states that on the MFJ-2990 antenna ". . . The entire length radiates to provide exceptional low angle DX performance . . ." This may not be the best choice for emergency communications in a mountain valley?

Chris-
Dipoles are a good suggestion. Relatively easy to make and inexpensive. If they are used as Near Vertical Incident Skywave (NVIS) antennas, by mounting them only 10 to 15 feet above ground, the "mountain valley" communication problem is solved.

For NVIS a dipole could be hung off the end of a roof ridgeline and made an inverted V with the ends at about 8 feet to keep them high enough to be mostly out of reach. Most modern single story house roof ridgelines would be approx. 16 feet or very close to the desired NVIS height. My own inverted V dipole has a bit of NVIS capability, since I have wires for 160 mtr, 80 mtr, 20 mtr, and 17 mtr, all center fed at about 28 feet. A little high for NVIS, but probably get a little on 160 and 80 mtr bands. Best point is that dipoles tend to be much less expensive than verticals, especially since they are much easier to homebrew.

Larry-
You're absolutely correct - under the existing antenna mounting conditions, the vertical would be a good choice. But don't forget about the "mountain valley" he wants to operate from. An NVIS antenna is the best choice for getting out of the valley. An NVIS dipole is only mounted 10-15 feet above ground. Therefore, relatively short poles would support it well.

Ross,

If you are like me, you want to get on the air yesterday but have learned that in a day or two you can learn something that reasonably makes you regret the prior decision to commit money and time to equipment that does not do all you want it to do. Since you are asking around to learn more, sooner, this is probably true of you too!

As Ken noted, the antenna selection is best made based on an analysis of a variety of factors. The fact you plan to use an FT-897D is only relevant because of two considerations. One is the characteristic of all modern HF transceivers that require close matching of the output with low SWR to get maximum design output and while protecting the rig from damage. The second one I will include in 1. below.

1. As Ken asked, how do you intend to operate? This takes into consideration bands and who do you want to hear you (where are they, local, DX both). Is this a temporary or "permanent" installation? Also, because of the portability of the 897, do you want to consider if you want one antenna you can use in different applications and or locations? What about the input power capability of the antenna? How long will it be before you get frustrated not being heard in DX pileups with only 100 watts PEP SSB? Do you want an antenna that can handle 100w or 600 watts CW or maybe 1.5 kw CW? Maybe two different antennae? But now we are getting into 2. below.

2. What opportunities and limitations do you have concerning what type of antenna you can use? (I like working all bands from 160 through 70 cm and have to contend with very restrictive CCRs and an aggressive architectural review committee with a manger that does monthly property tours/ inspections.) Based on the type of antenna you will use, what type of tuner will you need to properly match between the rig and antenna, if the antenna does not guarantee a low SWR across your range of desired operating frequencies without the need for a tuner or coupler?

3. What is your budget? Actually, for good financial management, set your budget first then conduct the above analysis.

4. What are other hams doing with similar operating interests, needs, budget? You appear to be addressing this item with the question you asked. You might want to ask the question in an antenna forum because, as I said, other than for the two things I mentioned above, it does not matter what modern rig you are using.

5. Right after budget, the ARRL intro book on antennae can help identify what questions to ask as well as provide answers. You can also search the internet for that info but I am more willing to trust the ARRL materials, having done so since studying for my novice exam in 1962. Having said that, I sometimes read

things in them that I believe are not the best advice. Sometimes it is limited to the author's experience, without the author having done a thorough job of researching the individual topics to see if the authors' options work best for the same or less cost. Sometimes people write about what they did (personal experience) based on a rather narrow review of available options. The age of the last edition of a publication is also important given how rapidly some technology is evolving. Consider the speed of the evolution of Yaesu VHF HTs. Even a thorough comparison, performed about 6 months ago, of then-available HT selection based on operational needs and interests versus equipment capabilities, would be outdated already for an avid APRS fan because of the recent release of the VX-8DR.

Personally, I prefer (but do not have one on HF now based in large part on #2. above) a balanced antenna constructed from a material with low loss properties, including of a sufficient diameter for the frequencies being used. To me, installing a really effective counterpoise for HF use (particularly on 160, 80 and 40 metres with a random wire, even one about 100 metres long) is laborious and adds unnecessary expense you can avoid with a balanced antenna. I've used both balanced and unbalanced and have found I've had less (sometimes none) RF issues in the shack and surrounding area (with 600 watts output) with a balanced antenna versus unbalanced (with 100 watts output), regardless how good a counterpoise I used. This was the case even with 4 @ 8 feet long ground rods appropriately installed for an equipment ground, separate from the counterpoise.

I have given you no answers, but hopefully guiding you in how to think about this lead you to optimal outcomes in your quest for the best (based on individual situations) antenna.

You may want to look at the MFJ 2990.. I wanted an all band antenna, I have this one. I put some hardware cloth on the ground below it for "ground screen". I use their radials, 32 of them. and 50ft coax and I have no problem going from 160 to 6 at all. You will need a seperate VHF/UHF antenna.

Regarding a dipole and only one tree, think of this as is with cosmetic surgery. What God has made, man can change.

At 1 mile elevation but with 2,000 metre higher mountain peaks to my east and CCRs, I did what Larry recommends below with random wire about 100 metres long on a 1/3 acre lot. I bought 3 @ 12 feet long pressure treated 4x4s. (16-footers were relatively more expensive and heavy for me to handle alone.) I then extended them with 1x6 inch wood on 3 sides of the 4x4s, so with 4 feet of the 4x4 in the ground, the top of the assembly is just higher than 15 feet above ground. For camouflage I mounted two bird houses on the "stealth masts" and a pulley near the top inside the 3 sided extension. I presume Chris has no restrictions on appearance of the masts, so he could stick up about anything for one or both ends of the dipole support. The wire is #16 CU coated steel from the Wireman, painted with 4 different camouflage colors so the CU does not glow in the sun and there is no one long color section of wire to draw the eye to a continuous line in the sky. Chris could use a larger diameter wire with no concerns about CCRs or aesthetics(from a non-ham perspective).

With 100 watts PEP SSB in the CQ and ARRL SS this year, in only a few hours 6 hours of search and pounce in each event I worked 20+ countries around the world in the CQ and 65 of 80 ARRL sections. I could not compete in piles ups with high power amps and beam antennae, but could squeeze in between 2 high power stations and make contacts with others using 100 watts or less others were not hearing. By search and pounce I could work high power DX when I got to them before the mob arrived. I used 80 through 15 metres successfully for these, depending on time of day.I can also hear and be heard by stations around NM on 80 m in the state ARES net with the 100 w PEP.

Chris, without having to deal with zoning or CCRs, you can focus on operating versus design versus budget and work the world with whatever you erect.

Ross,

As you know it all depends on what you want to do. I have a G5RV at 48 feet with north-south orientation on 100W and am talking the world on everything

from 80-10 meters. I have the AT-897 Tuner for the FT-897 and have found this baby will tune a wet noodle almost. Had to rethink the Mic Gain and Processor

sets because I was overdriving the radio and thought I had antenna problems. I am using a MFJ Discone for VHF/UHF and it works like a charm. Will have to

replace it soon because most of the radials popped off in high wind but it is still working good with only 1.5:1 SWR on VHF and UHF.

Hopes this gives you some ideas.

Randy,
Out of ignorance of antenna theory and HF in general I realize I didn't leave enough information. I am not into DXing. However, this fire dept is in a rural mountain area down in a valley. We have not even been able to hit a 2m repeater yet, so we need to know how to get out of the valley on ,probably, 20-40-80. Thank you for your response.

Do you have any one you know to contact in an emergency. What kind of emergency?
Emergencies can happen any time, HF propagation is iffy most of the time.
If it is a fire department there should be other means to get emergency radio communications set up.
Ham radio is a hobby, not a emergency service.
Dale

Hi Randy
The military use NVIS and that is what i would expect you guys to use, a whip antenna about 3-4 metres in length on the fire appliance bent over till it almost touches the body at the other end will send the signal sky wards which would allow you to be heard with in a 20-30 mile radius. Regards Robert

Actually, the U.S. military does not own the HF bands.

The FCC regulates one portion of HF while the NTIA regulates another.

While the FCC can shut the bands (in the U.S.) down for war and other national emergencies, we are still the primary users on our little slices of heaven.

I believe the only HF band we currently "share" is 60 meters.

Dale:

Unfortunately this is one myth that's taking a long time to die. Regional HF communications using NVIS can in fact be very reliable. It's all a matter of using the right antenna and selecting the right band. Having done that, there should be almost no time you can't establish reliable communications over a several-hundred mile radius, and often more. Many Hams don't believe this because they're used to using beams and vertical antennas that radiate at lower angles. NVIS uses antennas that radiate at high angles and take advantage of strong reflections and short paths to avoid absorption. Also, using antennas that are not sensitive to low-angle signals reduces noise and distant interference.

It's all a matter of band selection and using an antenna optimized for high radiation angles. In fact most HF dipoles used by Hams would be fine. Using the right band for the current conditions for FoF2 (which is a bit below MUF and nearly always somewhere from 160 through 40 Meters) will net you remarkably strong and reliable signals. From experience, we have as yet to have any exercise where we could not communicate reliably across our 17 county area with HF NVIS, including using simple temporary antennas and equipment (for which the FT-897 is perfectly suited).

The nice thing about this is that NVIS propagation will get you over hills and into valleys, and it's easy to setup an antenna for NVIS even if everything has been destroyed. This is why it's the best last-resort regional communications method for emergency/disaster communications--and frankly the first thing any E-Comm group should consider having available. Communications can be reliable and re-established regardless of any repeater or system loss.

Let's face it, fire departments and other emergency services are not familiar with HF communications and the regular training required for them to implement such systems, particularly to setup systems when others are destroyed, is an expense and a distraction they can't afford. Heck, they are hardly able to stay familiar enough with their primary communications systems to deal with required changes in emergencies when those systems get overloaded.

Yes, Ham Radio is a hobby, but Part 97, Subpart A, 97.1 (a) states... "Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications." This, the very first part of our FCC rules for Ham Radio, is a pretty clear statement of a primary reason we're blessed with as much spectrum as we have.

We can go into a long discussion about this, but that's outside the purpose of this list. Suffice it to say that in answer to the original post, NVIS HF is the solution he was looking for and Ham Radio communications to aid his local fire department and emergency services is not only appropriate for Ham Radio, but necessary.

I don't know anything about what the military uses and does not use, but our technician for our emergency group is a supervisor for Homeland Security and a former Green Beret in Vietnam. He says they used NVIS in the jungles in Vietnam because it cut through the smoke, etc. I know that during the fires here in San Diego the thick smoke really cuts down on UHF/VHF reliablilty.

From: dzrtram
Topic: 31850 Message: 31850

Ohmigosh, Ham not used in emergency use. Tell that to RACES, ARES, any OES, thousands of local radio groups, and on and on and on. One big reason for HF is to keep in touch with our OES, and to communicate with emergency groups within a 200 mile radius during the terrible fires and earthquakes. Where did the idea that ham is not used for emergencies come from? Even the ARRL has literature on emergency radio.

Unfortunately this is one myth that's taking a long time to die.
Regional HF communications using NVIS can in fact be very reliable. It's all a matter of using the right antenna and selecting the right band. Having done that, there should be almost no time you can't establish reliable communications over a several-hundred mile radius, and often more. Many Hams don't believe this because they're used to using beams and vertical antennas that radiate at lower angles. NVIS uses antennas that radiate at high angles and take advantage of strong reflections and short paths to avoid absorption. Also, using antennas that are not sensitive to low-angle signals reduces noise and distant interference.

Ham radio can be and is used for emergency purpose, but is is a hobby. Emergency is not its main and sole purpose. Some of the Agencies are installing Ham radio for their own emergency purposes and training emplyees to be Hams so they can legally operate.
There are other ways they could do this.

31855. Poor AM modulation

Yahoo group: FT897 (2010)
Date: 2010-11-24 21:51:02 UTC
From: graham787
Topic: 31855 Message: 31855

Q What is the expected AM performance supposed to be ?

Mine seems to be low and clipped , did a full s/w reset and that helped a bit , but the audio is very low , carrier is set to 25 watts as the book

I can tell it has usb & lsb and sounds ok on ssb rx but AM .. not convinced its working as should ?

Any ideas ?

tnx-G.

Dale:

That's true, you can't just pick up a mic and make reliable HF NVIS contacts unless you are actively sounding with ALE (automatic link establishment) or similar to get the best band (see HFLINK for a Ham ALE system). You can, however, have a protocol that lets you establish which is the correct band. That protocol can't be entirely based on getting the current FoF2 data from the Internet, which of course may not be available. Instead it may need to be discovered operationally, and if you're not doing sounding you just need appropriate operating procedures.

I would have to disagree, though, that we don't have the necessary bands to operate reliably using NVIS. It's not hearsay, it's experience. In our years of E-Comm work we have never seen a time where at least one band was usable for NVIS. I believe most people who have made any reasonable effort to evaluate NVIS will tell you this is true. This is actually where the 60 Meter band comes in handy at times because it does bridge a gap that might be a problem otherwise. Also keep in mind that in a disaster you may not be limited to the designated Ham bands.

I would also contend that you don't have other options for hilly or otherwise obstructed terrain. If repeater assets or other communications are unavailable due to power, damage, or interference, short of installing new repeaters or other relays (would could consume limited manpower resources) it's going to be NVIS. It's really that simple.

Again, all of this points to needing more experienced communications people to do the job -- meaning Hams.

All:

I need to correct one sentence.

"In our years of E-Comm work we have never seen a time where at least
one band was usable for NVIS."

should have been...

"In our years of E-Comm work we have never seen a time where there
wasn't at least one band usable for NVIS."

Proof reading does help. :)

Hi Graham,

do you have the 6kHz AM filter installed in your radio? If not, the radio
just uses the built in filters (LC or RC) on AM and the quality suffers.
To get really good quality you need the 6kHz filter installed as it is used
on both Rx and Tx.

From: Steve Yates
Topic: 31855 Message: 31859

Hi G.,

The bass inherent with the stock microphone does not work well with the low level modulation of solid state rigs like the FT-897D. It will cause distortion. These rigs are SSB rigs that do AM on the side. Flipping the switch on the back of the microphone to #2 will help somewhat. However, with the proper microphone the AM quality can be excellent. I have an Astatic 10-DA element and a D-104 element with a home brew FET impedance buffer in the base and the old timer AM guys on 7160 kHz and 3880 kHz say it sounds as good as any AM boat anchor. These old microphone elements tend to have a much higher frequency response then dynamic microphones. A Heil element may perform the same. It is the bass response that screws up the quality on AM with the FT-897D.

Fire Department and other agencies within a 200-300 mile radius. The Fire Department station is located in a valley surrounded by mountains. Therefore, VHF and UHF are not workable. He's exploring the possibility of using one or more dipole antennas in a NVIS configuration. While it's true that amateur radio is a hobby, it often is asked to provide a public service at times. That is one reason that RACES and ARES exist.

From: Mike Ernst
Topic: 16351 Message: 31862

Chuck,

I totally agree with your comments and would add one additional thought. While Amateur Radio operators consider this to be a hobby, that word does not appear anywhere in our governing document ☐ FCC Part 97. It states the following:

· §97.1 Basis and purpose.-
<http://www.arrl.org/part-97-amateur-radio>

The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:

(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications.

(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.

(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.

(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.

(e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

Mike Ernst, AE8U

Subject: Re: [FT897] Re: Antenna

Dale:

Unfortunately this is one myth that's taking a long time to die. Regional HF communications using NVIS can in fact be very reliable. It's all a matter of using the right antenna and selecting the right band. Having done that, there should be almost no time you can't establish

reliable communications over a several-hundred mile radius, and often more. Many Hams don't believe this because they're used to using beams and vertical antennas that radiate at lower angles. NVIS uses antennas that radiate at high angles and take advantage of strong reflections and short paths to avoid absorption. Also, using antennas that are not sensitive to low-angle signals reduces noise and distant interference.

It's all a matter of band selection and using an antenna optimized for high radiation angles. In fact most HF dipoles used by Hams would be fine. Using the right band for the current conditions for FoF2 (which is a bit below MUF and nearly always somewhere from 160 through 40 Meters) will net you remarkably strong and reliable signals. From experience, we have as yet to have any exercise where we could not communicate reliably across our 17 county area with HF NVIS, including using simple temporary antennas and equipment (for which the FT-897 is perfectly suited).

The nice thing about this is that NVIS propagation will get you over hills and into valleys, and it's easy to setup an antenna for NVIS even if everything has been destroyed. This is why it's the best last-resort regional communications method for emergency/disaster communications--and frankly the first thing any E-Comm group should consider having available. Communications can be reliable and re-established regardless of any repeater or system loss.

Let's face it, fire departments and other emergency services are not familiar with HF communications and the regular training required for them to implement such systems, particularly to setup systems when others are destroyed, is an expense and a distraction they can't afford. Heck, they are hardly able to stay familiar enough with their primary communications systems to deal with required changes in emergencies when those systems get overloaded.

Yes, Ham Radio is a hobby, but Part 97, Subpart A, 97.1 (a) states... "Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications." This, the very first part of our FCC rules for Ham Radio, is a pretty clear statement of a primary reason we're blessed with as much spectrum as we have.

We can go into a long discussion about this, but that's outside the purpose of this list. Suffice it to say that in answer to the original post, NVIS HF is the solution he was looking for and Ham Radio communications to aid his local fire department and emergency services is not only appropriate for Ham Radio, but necessary.

Dale,

I do not think it is a true statement that the military has a larger range of frequencies. Even if you combine all of the branches (Army, Navy, Air Force, Marines and Coast Guard) and all of the uses it is not all that large. If you look at the spectrum, the military has a lot less frequency than Ham Radio. Take a look at the radio spectrum chart at:

http://www.ntia.doc.gov/osmhome/allochrt.pdf.

Additionally, the ground forces of the military primarily want close in communications. If the signal goes too far it's a bad thing - keep in mind the enemy is listening. That is why they have done so much research into NVIS. I just retired from the military after 34 years of service. As a commander one of my concerns was a little thing called SIGSEC (signal security). We taught our radio users to keep transmissions very short. Most enemy had the ability to lock in Artillery fire on your antenna if you transmitted more than 9 seconds (rule of thumb). So there were entirely different purposes for radio communications, and therefore entirely different needs from an antenna.

In the case of mobile antennas (whips) being bent over and tied down, there are a few things to keep in mind. First of all this was often used for inter convoy communications - not long range. Long range military antennas were more often base station antennas. Also they were usually using one brand of mobile antenna on one type of vehicle (such as a whip on a HMMWV or before that on a jeep.) This was a tried and tested system. In the world of Ham radio, we have a large number of mobile antennas and hundreds of makes and models of cars that we put them one.

Gary,

The ITU is part of the United Nations - and as such has no ☐authority☐. They are not the world authority. Countries choose to belong to the UN or not. The ITU has the mission of trying to coordinate the shared global use of the spectrum. But they do so through ☐diplomacy☐ not through authority.

Subject: RE: [FT897] Re: Antenna

One amplification to this - The FCC only "regulates" the communications on the bands. They do not assign or own the Ham Radio Bands. Within the NTIA is the Office of Spectrum Management. They are the ones that formulate and establish plans for the use of the spectrum for all federal agencies. (The FCC is a federal agency.)

Subject: [FT897] Re: Antenna

Actually, the U.S. military does not own the HF bands.

The FCC regulates one portion of HF while the NTIA regulates another.

While the FCC can shut the bands (in the U.S.) down for war and other
national emergencies, we are still the primary users on our little slices of
heaven.

I believe the only HF band we currently "share" is 60 meters.

31866. Yaesu 897D, Stopped transmitting on SSB (LSB and USB)

Yahoo group: FT897 (2010)
Date: 2010-11-23 23:32:47 UTC
From: yaesu73
Topic: 31866 Message: 31866

My Yaesu 897D stopped transmitting on SSB (LSB and USB) everything else seems to be fine, worked a few stations in CW no problem. I did a factory reset and went back through the menu to make sure everything was the same, good to go. I looked at filters and they were set fine. It shows no power out when keying the hand mike in SSB and a dummyload also confirms this but in any other mode all is well. I take this radio out for portable but nothing has been done different to it, it just stoped working in SSB (hand mike still works in AM/FM). Please help

GE All,
I've been wondering about this incursion of new hams into the mix since the FCC has allowed people in the emergency field to be permitted to participate (while on the clock) in Emergency Drills. As a league VE, I think it is great to see new hams walk out with their CSCE's, however, it seems apparent that many of them are only doing it to fulfill and obligation to their employer and not for the love of the hobby. I hope that I am wrong in my assessment. I would also like to wish everyone a safe and happy Thanksgiving holiday!

Hi Joseph,

You are talking into the mic when you test, aren't you? You won't get any output until you do, of course.

Hi Joe,

And so what if they are, they may develop a further interest out of it.

We have quite a few people get their licences through our club who are doing
it for other reasons, such as yachties and we had one at our last course
who restores old military vehicles and wants to be able to use the radios.

I say, good on them. Every one of them is an extra one which adds to our
justification for the bands we have access to.

It's the same for the ISS astronauts, some ofthem are already hams and do
it for the love of it but others do it just so that they can continue the
school contacts which allow so many kids to get a taste of Amateur Radio,
a few of whom may go on to get licenced themselves as a result.

31870. Re: Emergency Use

Yahoo group: FT897 (2010)
Date: 2010-11-25 20:53:13 UTC
From: Radio_Randy
Topic: 31850 Message: 31870

Joe,

I AM an emergency communicator. I'm also a ham of some 29+ years.

Working for the State of Washington, I get paid to provide commercial communications services for wildland fires around the country. I'm also a volunteer in our local ARES chapter.

While it may appear counterproductive for folks to get their tickets just to fill their employer's needs, look on the positive side:

1. It increases the amateur ranks, thereby enhancing protection of our existing frequencies and bands.

2. It shows that more employers are beginning to recognize the value of the amateur radio service (otherwise, they'd just be trying to steal our bands).

As for the down side, we've seen many changes to amateur radio that were thought to negatively affect the hobby. Many folks thought the new Novice license would doom the hobby. The new Technician ticket ran into the same resistance. Let's not forget Novice Enhancement and the No-Code Tech changes in the 80's. Now, we've eliminated the Morse code requirement, entirely and cell phones and the Internet are considered threats.

The hobby has not only weathered these "attacks", but actually flourished because of them! Until I see a dramatic decrease in the number of hams in this country, or a sudden grab for many of our bands and frequencies, I'm not planning on losing sleep over it.

Maybe the rest of us shouldn't, either.

31871. Re: Emergency Use

Yahoo group: FT897 (2010)
Date: 2010-11-25 20:55:48 UTC
From: ke7adu
Topic: 31850 Message: 31871

I think the regulations make it clear that emergeny communications is one of the primary reasons amateur radio exists. I would also say that is why we still have the frequency allocations we have. I am sure there is money to be made by selling off our spectrum and the small number of hams are certainly not going to sway any political figures votes. It is our potential to provide emergency communications that keeps that spectrum available for our hobby.

To move on to the original question. Base on the tests our rural ARES group have done a 40/80 meter dipole at 20 feet or so should get you fairly reliable coverage. If you can add 160 to that even better. You will need to be sure the places you want to communicate with have similar capabilities.

FEMA has sent out HF rigs to cover all the EOCs in Idaho. However the contractor that is supposed ton install them still has not set them up. You might check and see if you state has some of this equipment. Its not ham but will provide HF links to your states emcom folks.

Hope some of this makes sense. My iPad is great for reading but can be a little challenging for typing longer replys.

One big reason for HF is to keep in touch with our OES, and to communicate with emergency groups within a 200 mile radius during the terrible fires and earthquakes. Where did the idea that ham is not used for emergencies come from? Even the ARRL has literature on emergency radio.

From: DALE
Topic: 31850 Message: 31872

Another slant on what another group wants to do for emergencies.
Info only. Just what is happening. Partial quote from long article.

You don't need to do all that -
or any of that -
because in the US
you don't have to have a license
to own the equipment -
(which is not the case in many other countries).
You just need to have the license
to operate the equipment.

In point of fact -
the US law says you don't even have to have a license -
to operate in a time of emergency -
like what we are talking about -
(which makes sense -
because no one would be checking any way.)

The VERY SPECIAL equipment that I am talking about
will be so simple that you will be able to take it out of the box -
and follow our simple instructions -
to have it working -
without having taken the course -
but it would be nice if you did take the course
so that you could practice - ahead of time.

The system we are designing
(and I am getting some very knowledgeable help about this)
is for our survival paradigm
rather than for the Ham hobbyist paradigm.

Let us compare the two.

Hams: want to be able to do as many things as possible.
(To be able to send Morse code -
to be able to send TV signals -
to be able to bounce signals off the moon -
To be able to transmit from their car or boat -
To be able to use the very wide spectrum of frequencies available to them.
To be able to communicate around the world.)

SAFE: Needs reliable communication over one bandwidth.

Hams: Often pay many thousands of dollars for their equipment.

SAFE: Needs an inexpensive system that can be obtained for under $200.

Hams: Want to learn and study complicated theory.

SAFE: Needs a very simple system that anyone can work as it comes out of the box.

HAMS: Have to be licensed and at the higher levels have to pass a very difficult test.

SAFE: Needs a system that can be operated by anyone at time of catastrophe.

HAMS: Except in time of emergency send messages of very little significant value. They are mostly of the "I hear you - do you hear me, variety".

SAFE: Needs to be able to reliably communicate critically important messages.

Not all Hams have all capabilities.
In point of fact -
most Hams work within a relative fixed range of skills -
although those skills differ from Ham to Ham.

Many Hams belong to different clubs
and organizations
that develop particular types of skills,
or who have particular types of equipment,
or who participate in specific activities -
oftentimes within a specific geographic area.

It takes lots of expensive equipment -
and very elaborate antenna systems -
plus years of study -
to be able to do everything.
Nevertheless, most any reasonably advanced Ham
will be able to communicate with the SAFE system -
AND -
there are many thousands of Hams who use practically no other system.

The SAFE System is a two way system.
You will be able to communicate with most Hams -
and most Hams will be able to communicate with you -
BUT they will have to do it with you
in the particular band -
using the particular method -
that SAFE has chosen.

I am planning to send out
another Newsletter
within the next couple of hours -
describing how the SAFE system works,

but first -
a grand overview of the ideal.

The SAFE Network is based upon our having
SAFE TEAM members
throughout North America.

The SAFE Ham Network system will be quite capable
of reaching say Europe -
if you wish to communicate with someone there.
It will be completely within the capability of your equipment.

But the SAFE purpose
is not the HAM purpose -
to rack up 'brownie points'
by being able to say you have talked to people -
in this far off place and that.

The purpose of the SAFE system
is to communicate critical and essential information -
at a time of catastrophe
when no other communication systems are working.

A time when -
the phone isn't working.
A time when the TV isn't working.
A time when there are no newspapers.
A time when the radio isn't working.

If you can't imagine such a time -
then you can't imagine a need for SAFE -
and the need for a SAFE Network system.

But if you can imagine such a time -
you may be able to imagine how
you might want to be able to hear
from the SAFE Network system -
how things are in some other specific locality.

You might be able to imagine how
you might want to be able to find out
a safe path from one locality to another.

You might be able to imagine how
you might wish to be able to inquire
how someone else is in a distant locality.

You might be able to imagine how
you might wish to let someone at a distance
know how things are in your locality.

You might be able to imagine how
you would like to be able to locate someone

with particular expertise
to help you solve a specific problem.

I could extend this list on and on -
but if you can imagine the above -
then you can imagine many, many reasons
why you would like to have a way of communication -
when there are no other ways of communication.

In the accompanying email
I will describe in detail
both the technical means
and the organizational means
by which the SAFE Network system
is being developed to work.

Hi Stanton:

This is not an antenna group, so would it be possible for you to send the picture of yours to my personal addres?
Thanks for sharing!

Subject: Re: [FT897] Re: Antenna

Regarding a dipole and only one tree, think of this as is with cosmetic surgery. What God has made, man can change.

At 1 mile elevation but with 2,000 metre higher mountain peaks to my east and CCRs, I did what Larry recommends below with random wire about 100 metres long on a 1/3 acre lot. I bought 3 @ 12 feet long pressure treated 4x4s. (16-footers were relatively more expensive and heavy for me to handle alone.) I then extended them with 1x6 inch wood on 3 sides of the 4x4s, so with 4 feet of the 4x4 in the ground, the top of the assembly is just higher than 15 feet above ground. For camouflage I mounted two bird houses on the "stealth masts" and a pulley near the top inside the 3 sided extension. I presume Chris has no restrictions on appearance of the masts, so he could stick up about anything for one or both ends of the dipole support. The wire is #16 CU coated steel from the Wireman, painted with 4 different camouflage colors so the CU does not glow in the sun and there is no one long color section of wire to draw the eye to a continuous line in the sky. Chris could use a larger diameter wire with no concerns about CCRs or aesthetics(from a non-ham perspective).

With 100 watts PEP SSB in the CQ and ARRL SS this year, in only a few hours 6 hours of search and pounce in each event I worked 20+ countries around the world in the CQ and 65 of 80 ARRL sections. I could not compete in piles ups with high power amps and beam antennae, but could squeeze in between 2 high power stations and make contacts with others using 100 watts or less others were not hearing. By search and pounce I could work high power DX when I got to them before the mob arrived. I used 80 through 15 metres successfully for these, depending on time of day.I can also hear and be heard by stations around NM on 80 m in the state ARES net with the 100 w PEP.

Chris, without having to deal with zoning or CCRs, you can focus on operating versus design versus budget and work the world with whatever you erect.

Hank,

I just confirmed the connection between my PK-232MBX and FT-897D and am NOT experiencing the same problem. I did, however, determine that my cheap Rat Shack power adapter does not work with it, HI!

Why don't you double check your wiring? You might even reply to this and send us a pinout of your hookup between the units. Then, maybe we can help determine if it's a wiring error or not.

BTW, I don't know about the rest of you, but I get my interface cables from discarded mice and keyboards. Much cheaper than the factory cable, but you need to know what to look for.

Hank,

I almost forgot the simplest check.

Before doing anything else, disconnect everything but power and data connections to the PK-232. Then turn it on and see if it still kills the audio from your radio. That way, we can confirm the software is not at issue.

Hi Randy, thanks for the reply. I□m also thinking that the problem is with the data cable, so I ordered a pre-made cable from Buxcom. I should have the cable in a few days, and then I am going to try it again. I will post back my results when I try the new cable.

Eric,
This is an excellent point you make sir but my only issue with it is this: operating as control operator having a pecuniary interest is not amateur radio it then becomes commercial radio and hospitals and emergency responders already possess this equipment. I am all for bolstering the ranks but this seems to cross that line.

Hi Joe,

And so what if they are, they may develop a further interest out of it.

We have quite a few people get their licences through our club who are doing

it for other reasons, such as yachties and we had one at our last course

who restores old military vehicles and wants to be able to use the radios.

I say, good on them. Every one of them is an extra one which adds to our

justification for the bands we have access to.

It's the same for the ISS astronauts, some ofthem are already hams and do

it for the love of it but others do it just so that they can continue the

school contacts which allow so many kids to get a taste of Amateur Radio,

a few of whom may go on to get licenced themselves as a result.

Hi Chris
As most of us know the military control the radio spectrum and are at liberty to use the radio spectrum for any use they deem fit.
we have the use of bands within the HF bands for our hobby, it has been like this since radio was first used at the turn of the 19th century into the 20th century, and now the 21st century. like a lot here in United Kingdom they are under some mis happrehension that they that is the amateurs have sole use of the radio spectrum, but we all know this is not the case.
It is a also for self training should our services be requested by our governments.
Regards Robert G6LLP

My Yaesu 897D stopped transmitting on SSB (LSB and USB) everything else seems to be fine, worked a few stations in CW no problem. I did a factory reset and went back through the menu to make sure everything was the same, good to go. I looked at filters and they were set fine. It shows no power out when keying the hand mike in SSB and a dummyload also confirms this but in any other mode all is well. I take this radio out for portable but nothing has been done different to it, it just stoped working in SSB (hand mike still works in AM/FM). Please help

The military certainly do not control the spectrum in the UK. Frequency co-ordination is carried out by Ofcom, a frequency allocation branch in the Ministry of Defence, and the Civil Aviation Authority, all in colaboration, restrained by international agreements. The military are restricted to very defined areas outside which they are not permitted to stray

You are talking into the mic when you test, aren't you? You won't get any output until you do, of course.

no power output unless you speak into the microphone as the transmitter is powered by some audio be it speech or an audio signal the same is true of any ssb transceiver which tells me you are new to this hobby

Eric and Robert,
 Thanks for the write back, yes I am talking into the mic. Again I get power out in AM/FM/CW (talking into the mic or mashing my key) just not in LSB and USB. I contacted yaesu with the same question and they came back very quick with (send it in, $70 an hour). I am all about figuring this problem out but as Robert had guessed I am very new to this hobby (not sure how that was supposed to help). Any suggestions are greatly appreciated, thanks again for the response.

Hi Gents,

I am getting interested in AM transmissions also - and a local net tells me my AM TX audio sounds bad using my 897d 'Very nasally, and rough round the edges difficlut to copy although good signal' so I have been following this thread with interest.

Where do I obtain one of the 6khz AM filters from - I can not find it listed anywhere under options for the 897, or listed seperately.

Finally - the 6khz filters - works on TX audio aswell as RX right ?

Any weblinks please ?

Thanks for help in advance

Try unplugging you paddle from the unit and see if that works. Several people in the past
threads on this group have had problems with the keyer being stuck. Also make sure Menu 22
is in Off when trying SSB. Had that on once and couldn't modulate on SSB or digital.

Wrong.

As long as the key contacts aren't closed, a paddle can remain connected
and the rig operated on SSB even with Menu 22 set to ON.

I've operated the rig that way for years. Many CW ops do. It allows CW
to be sent while the rig is in CW mode. Likewise the K3 and several
other rigs.

but if the key is not fully inserted by accident (as noted many
times in this group) it makes the 897 perform very erratically

31892. Re: [FT897] RE:

Yahoo group: FT897 (2010)
Date: 2010-11-26 18:45:06 UTC
From: K9ZTV
Topic: 31884 Message: 31892

Good point. But that's not the fault of the rig.

All hams, regardless of brand of radio, should be certain ALL their plugs mate correctly in ALL their radios and accessories. A good percentage of reflector posts could be eliminated overnight if they did so.

In the case of the FT-897(D), the holes in the rear panel surrounding the jacks are not large enough to accommodate SOME of the plugs being used by hams for various and sundry interconnections. For plastic plugs, the solution is usually minor surgery in which the plug's shoulders are whittled down with an X-Acto knife until the plug slides easily into the jack. Likewise, for plugs on cables supplied (or formerly supplied) by LDG for use with their AT-897 tuner.

I thought 22 control the side tone on the CW. That is what I was having a problem with and turned off 22 and it went away.

Well Denny, I don't know why you are having a problem with menu # 22 being turned on. I have # 22 ON and have absolutely no problem getting my 897 to transmit in SSB or Digital. I like the fact that I can drop my call in CW when checking into a net if the SSB copy is rough.

Totally agree with you Jeff but exactly who uses a particular bit of
spectrum depend on many things, including who hold the SA80 at that
particular moment. Sadly, in the UK and many other countries, it is all open
to the highest bidder so perhaps it is the Treasury who calls the shots!

31895. No Frequency Display

Yahoo group: FT897 (2010)
Date: 2010-11-26 21:22:47 UTC
From: voskiarzat
Topic: 31895 Message: 31895

All,

The rig is an FT-897D, today turned on the power supply on and I get no freq. display on the rig, but I hear the fan is running continuasly.
The on-off switch is not even turning fan off. When I turn the power supply switch to off, I see the display light momentarily and the fan is turned off.

Any ideas what the problem is? What can I do to correct the problem?

Regards.

Noel (OM) N3NZ

From: Joe Radio
Topic: 31898 Message: 31898

Group,
 Thanks for the write back, my mic setting are all set at 50. I have tried it with key plugged in and out, I have a dummy load that I can read the voltage when keyed as well, I get voltage on every thing except SSB (USB and LSB). My CW/AM/FM all work fine, made a few contacts the same day I could not run SSB, no problems. So my mic works fine, key works fine, my ldg tuner works fine as well but again it wont tune in SSB only the other modes. I have been testing the rig now bypassing the tuner all together. If I knew what I was looking for on the inside I would dive in, have the schematics but am not the most experienced at this, any guidance would be greatly appreciated.

Ok . I dont think this is a bass / bw problem the audio is quite good on fm and ssb , also the am audio sounds fine but very low level . which then tends to clip and crunch as you turn the gain up ..it seems to be double side band .. and when you monitor in ssb , sounds fine .. something odd about the mod/carrier ratio and/or the liniarity of the modulator .. are all the ft897 like this ? as I can see them new for £750 ~ $1400 .. thats a lot for a box of crunchies

These rigs are SSB rigs that do AM on the side. Flipping the switch on the back of the microphone to #2 will help somewhat. However, with the proper microphone the AM quality can be excellent. I have an Astatic 10-DA element and a D-104 element with a home brew FET impedance buffer in the base and the old timer AM guys on 7160 kHz and 3880 kHz say it sounds as good as any AM boat anchor. These old microphone elements tend to have a much higher frequency response then dynamic microphones. A Heil element may perform the same. It is the bass response that screws up the quality on AM with the FT-897D.

What nobody has really addressed is that the '897 uses low level modulation for AM. It does not use high level "Plate/Collector modulation". You want high level AM get yourself or build an AM transmitter. AM is just an after thought for most all SSB rigs. The old rule of thumb was that it took half as much power in the modulator as the RF deck for high level mod. Worked that way in some of the broadcast xmitters I worked on.

> What nobody has really addressed is that the '897 uses low level modulation for AM. It does not use high level "Plate/Collector modulation". You want high level AM get yourself or build an AM transmitter. AM is just an after thought for most all SSB rigs. The old rule of thumb was that it took half as much power in the modulator as the RF deck for high level mod. Worked that way in some of the broadcast xmitters I worked on.

There is no reason that low level modulation should produce any worse results than high level.

Traditionally AM transmitters use high level mod but that is just for efficiency, because a Class C PA can be used.

Since the 897 is an ssb transmitter, it already has a linear amplifier system which will amplify low level AM just as well as SSB.

Of course the peak of the AM envelope must be kept below the 100W max o/p of the 897, so the carrier power must not exceed 25W with 100% mod.

Regards
Jeff

Well Jeff I worked in the broadcast business for 18 years which is no big deal. But we (in the US) were allowed to go up to 125 percent mod over the peaks, but no more than 100 percent downward. I have listened to different rigs over the years, and none of the "Made for single sideband" rigs sounded as good as high level plate modulation transmitters did. What is the attraction for AM? Carrier just goes along for the ride.....

Well , yes , the big boomers are now using envelope restored class E finals , so low level modulation is leaking into BC as well as AD set-up's..I have a trp5000 which uses low level modulation for AM , but the mod index is close to -2- 100 watts carrier and 400 watts peak , with one side-band ..

However I still use the ft897 on 80 ...Yes looks like its time to take a closer look , Im not convinced there is not a fault , as the audio seems to break on peaks

Q is the ALC used to set the 25 w as on TX the meter shows abt 75% fsd .. is this normal ?? Tnx - G.

31910. Rebuild 897 internal battery?

Yahoo group: FT897 (2010)
Date: 2010-11-27 22:31:38 UTC
From: Clark
Topic: 31910 Message: 31910

Anyone attempt this? Looks like C or sub-C cells would be in there, 11 in all, I've not tried to split the case open yet, but plan to. Any info out there on it?

If it is potted in there or hard to get at I'll probably buy some new ones. I just wish Budd would fix us up an A123 lithium pack that fits inside the 897, but I'll settle for nimh for now.

From: aa5fr
Topic: 31911 Message: 31911

I'm selling my personal Timewave ANC-4 Noise Filter and my Timewave DSP-599ZX Audio Noise Reduction Filter.

If you have a lot of local QRN, these may be your solution. They have been indispensable for me as a cliff dweller with all the noise that comes from living in high rise condos! Both filters worked well with my FT-857D, FT-817ND and my FT-897D.

Details, photos and pricing, along with links to the manuals, data sheets, etc. are at my web pages. Direct links:

ANC-4: http://aa5fr.com/anc4.htm

DSP-599ZX (latest firmware): http://aa5fr.com/dsp599zx.htm

Give yourself an early Christmas present!

Actually...

FCC Rules Part 97.3(a)(4):
Amateur service: A radio communication service for the purpose of self-training, intercommunication and technical investigations carried out by amateurs, that is, duly authorized persons interested in radio technique solely with a personal aim and without pecuniary interest.

It is because of the knowledge that gain by adhering to the above definition that make us good emergency communicators, not the other way around.

Now, about that FT-897D...

From: JP Douglas
Topic: 31913 Message: 31913

Hi all,

We've had the 897D for over a year now and this afternoon I decided to cheque out 60 metres.
I heard two frequencies coming in loud and clear.
I space out and tried to tune the rig, the LDG AT-897 Plus started to act strange. Then I realised that when
you're on 60 metres the radio won't go to AM to tune as it does on other bands.
Regardless, swr was acceptable, though I haven't tried to make any contacts as of yet.

Just thought I'd through that out to stop the emergency vibes that are out there....;-)

From: Dan Schaaf
Topic: 31913 Message: 31914

That is OK, because it is illegal to tune on the air on 60 meters.
The apprpriate method is to permanently tune the antenna using an analyzer, adjust the antenna length accordingly, then go into transmit.

Topic: 31910 Message: 31916

Well, opening up the FNB 78 pack was easy. Has 11 4/3 AF cells in there. I think I can rebuild the pack for about 50 in materials (on sale) and an hour or so, but I am wary of the soldering of the tabs solidly in the pack without damaging the cells. I have found replacement FNB 78's for $89 and just may go with that.

I understand (second hand) that Budd finds the A123 cells a tad wide for the compartment of the 897, so I don't think we'll get them internal. Darn.

As far as I am concerned, emergency use is as valid a forum subject as contesting or ragchewing or technical subjects. Actually it is even more
important as it is a fundamental purpose of amateur radio. The 897 seems to be made for the purpose because it is durable and perfect for field use.

> Are there any software solutions for menu control of my 897d ?

There are many, including HRD, FLDIGI, and FLRIG. WSJT and MULTIPSK will also do some control of the FT-897.

If you look at page 64 of the user manual, you'll see that there's a disappointingly small amount of controls exposed through the CAT interface, for example it would be nice if RF POWER SET were added to the list.

So there are lots of options to control the radio, but none may control as much as you'd like.

Topic: 31855 Message: 31919

The problem is simple, and so is the fix.

You need to apply a -4 to 0 volt signal to the ALC input on the jack on the backside of your radio.

The clipping sound your getting is actually ALC doing it's job.. SO, we have to show the ALC who the boss is...

w8ji has a schematic that will let you dial the exact power output you want, via a potentiometer, and a 9 volt battery. You have to take the carrier level on the internal menus and set it to 100 watts, then use the potentiometer to dial your carrier to the level you want. The 857 / 897 can have BEAUTIFUL audio that will rival any other radio / combo out there, but you HAVE to disable ALC.

If you have both a pep and avg reading wattmeter, you can see it in action... As well as a spec-an or scope. The PEP meter will be showing an INCREASE in Pout, to the tune of 55-70 watts on a peak, but the AVG meter will go DOWNWARD, at times to the 15 watt level, from a 25 watt carrier. By overriding the alc, we lose this effect.

There is NO reason a high level radio sounds better or worse than a low level radio, except when someone who doesn't know what they are doing, doesn't care, or doesn't understand how to operate the radio.

Also, the ALC pot trick might screw with appliance operator tunas that automagically lower Pout... Not sure how each and every one operates....

Hope this helps. I didn't have the url handy for w8jis AM website, but a simple google or yahoo search will turn it up.

31921. UHF Amplifier

Yahoo group: FT897 (2010)
Date: 2010-11-28 21:16:33 UTC
From: David
Topic: 31921 Message: 31921

The 897D's maximum output wattage on UHF is only 20 watts (at max) and it is just barely adequate to make it to a local repeater when there is a lot of traffic. However, it has been something I've lived with. The other day I bought a Kenwood TM-D710A mobile that I set up for my car, and while programming it in my house, I set it for 50 watts (H) on UHF, and using the same house antenna, I noticed that I was able to make the trip to that repeater with no issue at all. It was refreshing for a change. Of course this is no surprise since it is 30 watts stronger.

My question is this... Is there an amplifier on the market that I can plug my Yaesu FT-897 into that will boost the wattage to at least 50 watts or higher? I was once told I don't need a tuner because I only work VHF and UHF, and at the moment, I only have a VHF/UHF antenna. Also, I'm really not looking to do anything illegal, I would just like for my 897D to have a little more power as the Kenwood D710A has. Any suggestions would be greatly appreciated.

For 70 cm, take a look at the Mirage D-1010-N. With 10 watts in, you get 100 watts out on 70 cm. Or for dual band, there is the Mirage BD-35; up to 7 watts in gives you 35 watts out on 2 meters and 45 watts out on 70 cm.

Simon:

Specs say the FT-897 and FT-897D both have 6 KHz filters for AM. Also, I don't see any options for any other AM filters.

As people may have said here, don't expect too much and don't drive the mic audio very hard. Also, the comments about the mic might be right, but depending on which mic you're using (particularly if the stock Yaesu mics) you may want to try talking across the front of the mic rather than directly into it. In any case, the audio is not going to just jump right out at you.

From: Radio_Randy
Topic: 31910 Message: 31930

If you have a Batteries Plus store, locally, I would check with them about battery pack rebuilds.

I've had laptop, power tool and test set batteries rebuilt by the store in Spokane and they've done a first class job. They were also quite reasonable.

David,

There are no "illegal" amps for anything over 30 MHz. That rule was written for the bootleg amps a number of CB'ers were using (27 MHz) in the 70's and such.

Jose,

I've had no problems with my LDG autotuner on 60 meters, although I don't have the Yaesu specific model. Maybe it was your antenna and not a tuner issue.

Noel,

Disconnect everything from your radio. Internal batteries, mike, key, etc. Then try to power the unit up.

If the fan is still running (and the display is blank), try doing a master reset as per the manual, anyway, and see if that helps. Barring those steps (unless someone has another idea), your rig might just be heading to the shop for repairs.

31935. Re: [FT897] UHF Amplifier

Yahoo group: FT897 (2010)
Date: 2010-11-29 15:43:52 UTC
From: D F
Topic: 31921 Message: 31935

My first question is - How high is your antenna? As a base station (assuming that is where you are operating) the higher the antenna (VHF/UHF wise) it should be as high as possible. Also, if there are any obstructions to the "line-of-sight" from antenna to antenna, that will definately hinder a signal, especially on UHF freqs.

Second, what "type" of antenna (mobile, j-pole, other type of "base" vertical) are you using? if using a mobile, that can also hinder a "base" UHF signal.

In most instances, 20 watts is plenty enough for "local" UHF communications. It may NOT be the power that is the problem, but the antenna. I have always said that an antenna is 90% of your system. It matters not if you have the most expensive radio in the world, all the tuners or amps or filters, etc., if the antenna is in-effective, so will your communications be in-effective. I would say start with the antenna and make sure it is working as effectively as it can, then if you still have issues, then try something else.

Hope this helps.

Subject: [FT897] UHF Amplifier

The 897D's maximum output wattage on UHF is only 20 watts (at max) and it is just barely adequate to make it to a local repeater when there is a lot of traffic. However, it has been something I've lived with. The other day I bought a Kenwood TM-D710A mobile that I set up for my car, and while programming it in my house, I set it for 50 watts (H) on UHF, and using the same house antenna, I noticed that I was able to make the trip to that repeater with no issue at all. It was refreshing for a change. Of course this is no surprise since it is 30 watts stronger.

My question is this... Is there an amplifier on the market that I can plug my Yaesu FT-897 into that will boost the wattage to at least 50 watts or higher? I was once told I don't need a tuner because I only work VHF and UHF, and at the moment, I only have a VHF/UHF antenna. Also, I'm really not looking to do anything illegal, I would just like for my 897D to have a little more power as the Kenwood D710A has. Any suggestions would be greatly appreciated.

I am using a Yaesu VX8R HT at 2.5 watts and I reach the repeater at about 15 miles away from inside my apartment. No trouble at all. I also have a FT-8900 that I have set up in the shack set at 5 watts that is hooked to a copper J-Pole that works excellent. I did have to move it to clear line of sight obstructions but when I did move it, it worked real well. You could determine where the repeater is and check if there might be a building of some kind directly in line and you might have to move your antenna so that it either bounces signal from a building or changes a line of sight situation. My FT-897D hasn't been tried on the UHF freqs, might have to try it to see how it works.

HI Randy,

Your info makes sense to me now. When I had no response from the group, I disconnected the Cat cable, signaLink,
MFJ auto tuner and Iambic keyer and turned the radio and power supply off. The next day, switched the PS and radio on
and every thing was normal again, what a relief!
I am trying to remember what caused the problem, a lesson to learn from my mistakes.
1- Turned off the switch from the power supply while radio is on?
2- FT-897D and the Kenwood TS-450SAT share the same power supply... I'll be paying attention more closely to
switch things off orderly.

73's Best regards, Noel (OM) N3NZ

I agree with Dale, David.

Another thing could be: put the antenna higher and use better quality coax and connectors.

What are you now using for antenna (type), cable (type and length)?

If you use it only for one repeater , a yagi could be an option.

Be careful! A higher gain antenna won't necessarily get you better range.
Higher gain antennas have a different angle of radiation and that,
sometimes, can even limit your range, specially if one is operating in
mountainous or hilly terrain.

You are correct that the AT-897Plus will not tune the conventional way
on 60m, because the Yaesu FT-897 will not go into AM mode on these
channels to generate a carrier. However, the following alternative
method works for me:

+ Set your PO down to a low value. 10W is more than sufficient.
+ Select the channel you want to use on the FT-897.
+ Take a deep breath.
+ Hit the "Tune" button on the AT-897Plus until the red light comes on.
+ Release the Tune button, quickly key the mic, and give a long slow whistle.
+ If you run out of breath before the tune cycle is complete, quickly
inhale and keep whistling.
+ Readjust the PO as necessary, but in no case to >50W (per regs).

This method works fine for me.

31946. [FT897] Bad recieve sensivity on VHF

Yahoo group: FT897 (2010)
Date: 2010-11-29 19:16:47 UTC
From: Bitpool
Topic: 31946 Message: 31946

Hi!

My Trusty Ft897, has gone bad on the RX but only on VHF, all other bands seems to work as usually, has anyone seen this error before?

I took a guess and changed Q1024, but no luck, the S-meter will not show any more than S6 no matter what? I "assume" that it's is not related to the switching diodes as the same circuit handles the signal path to UHF and the lower VHF area which show no error at all?
It's not that easy to troubleshoot this rig, as it seems most of the recieve unit is placed on the backside of the pcb :/.
So my hope is that some one has a clue of where to look?

Best 73's de oz8abr /Michael.

Lest we forget. Try going into CW , using a straight key and low power
will achieve the same as the whistle routine except you have more control
in the process. :-)

That is correct.

What I do is partially what has been suggested before..

I have a roller inductor tuner. I get out my trusty MFJ-259B, connect it to the wire via the tuner, and adjust the tuner to a flat match on the channel I want to use, then hook the radio back up and talk away. Takes maybe 1 minute of my time....

I should note, the best way would be to have a dipole cut to the frequency you want to use, but impractical for most of us. I use a 6-160 Windom antenna and it works quite well on 60 meters....as long as it is tuned correctly.

Much success in whatever you do..60m is a gas!

Won't work...No CW in 60 meters (The radio will not go into CW mode while set to any of the 60m channels), and..as has been said in the previous message in this thread...tuning is not allowed in any of the 5, 60m channels.

Jay

Key down or whistle, if the carrier is zero beat, it is not permitted on 60 meters.
Plain and simple.
Use an antenna analyzer and put the tuner between the analyzer and antenna. Then tune the tuner for low SWR and document the tunr settings.
Then in the future, when you want to transmit on 60, set the tuner according to the documented settings.
Otherwise cut the antenna to be resonant on 60 and forget the tuner.
The FCC clearly states that tuneing on the air on 60 is not permitted.
http://hflink.com/5mhz/
You can read it in item 4 under Useful operating techniques for the 5MHz channels:

Michael, your problem may indeed be hardware, but before you delve too deeply into your rig, take a look at the VHF adjustments in the service menu to see if they all look reasonable. In particular, I'd be curious to know what the setting for menu item NO-005 VHF-RXG (VHF-Receive Gain) is. It should probably be set somewhere around 80. If it is zero or very low, that may be your problem.

I recently posted about a glitch I had with my 897, which manifested itself in several squirrelly problems after the rig spontaneously did a full CPU reset imediately after power-on, the most significant of which was that it would only put out around 40W on 160m. At this point, I believe the problem to be purely software -- somehow some of the memory holding my service menu alignment values got corrupted.

Please note: The service menu is alignment data, and as such, there are no correct default values. What is stored there is data which is analagous to the internal adjustments you'd make to the variable components on the rig's boards during alignment at the factory and the correct values will vary from rig to rig. Normally, you never touch these unless you are doing a re-alignment, and as such, I never bothered to look at them prior to the glitch. However, given that I've lost some of this data, it appears I'll now have to reprogram some of these values.

And, given these values appear to be corruptible, I very much wich now that I'd gone into the service menu and recorded them previously. Had I done so, it would have been trivial to restore them after this glitch. Now, it appears I'll have to do a partial alignment.

Remember, these values should not be adjusted without good cause, but going into the menu and recording them certainly seems prudent.

For more information on the service menu items, see the service manual, or see the file "ft-897_alignment.pdf" in the files section of this

yahoo-group, which I think is available here:

Be careful! A higher gain antenna won't necessarily get you better range.
Higher gain antennas have a different angle of radiation and that,
sometimes, can even limit your range, specially if one is operating in
mountainous or hilly terrain.

I'm not am not suggesting breaking any rules. Perhaps using a single tone will do the trick. However, care must be taken to keep your transmitted signal within the bandwidth restriction set forth in the rules.

Speech Processing should be "off" to remain within the parameters set by the FCC and the 50Watt ERP should be adhered to. You wouldn't know that these restrictions exist if you monitor the band.

Of course an antenna analyzer and a cheap manual atu would solve the tuning problem. :-))

Dan (et. al.),
I don't wan't to get into a flamefest over this, but the regs for 60m
do not address "tuning". They only address modes of operation.

Below is a snippet from the ARRL's 60-meter FAQ, which can be found
in its entirety here: http://www.arrl.org/60-meter-faq

"But if USB is the only permissible emission, how can hams "tune up"
on 5 MHz? That might mean putting out a carrier.
...
Most automatic tuners do require briefly transmitting a small amount
of carrier over the air. Not recommended but probably legal (as long
as you're not interfering with other stations) would be the tried and
true "whistling" or "hellllllooooo" methods."

I will also point out that antenna analyzers are no panacea. They
work by injecting a small RF signal into the antenna, too.

Reasonable people may disagree on the interpretation of the rules, and
if you believe a whistle is contrary to the rules, by all means don't
do it.

These are my final comments on this matter here,
Rob / KD8WK

60 metres on 897, being that it's programmed in, won't let you go to CW, it stays on USB.
It didn't look like I was getting extremely high SWR anyway, maybe 2:1

Jose,

It seems that a few people are having problems with the LDG tuner and 60 meters on the 897D. My first response was that my LDG Z-11Pro tunes up fine on 60. What I didn't take into consideration is the fact that my radio has been modified.

The fact is that my 897D was given the "wideband" treatment. Because of that, it will do ANY mode (and freqency) on 60 meters and not just USB. This is probably why my autotuner operates normally.

It looks as though you may just have to use one of the other recommendations given for tuning, unless you decide to do the wideband mod, yourself. Of course, operating 60 is more complicated when you have to tune in the frequency, select USB, etc, etc.

Good luck and 73.

Noel,

I'm glad to hear your radio is working, again.

In the instructions that came with Yaesu's internal power supply, it is stressed that you power the radio off prior to turning the supply's switch off. This may partly be due to the fact that when your remove power to the radio, without turning it off with the button, the radio will come back on the the same state as before you removed power. Maybe that had something to do with your issue.

I don't see a problem with running both rigs from the same supply as long as the supply can handle the total draw. I run my 950, 897D (some times) and 2 meter rig all on the same 20 amp supply. As long as I don't try to transmit on multiple radios at once, everything hums along fine.

From: eric@van-de-weyer.org
Topic: 31946 Message: 31963

Hi Michael,

before you try anything else, do a complete reset of your radio.

I have had the same problem a few years ago on my FT100D and about a month ago on my FT857D, which is the same radio as the 897D, and in both cases, a full reset fixed it.

If you have memories programmed, then i suggest you download a copy of them first so that you can reload them into the radio after you do the reset as it will clear all the memories.

73....Eric VK2VE.

31964. MIC Plug and Echolink

Yahoo group: FT897 (2010)
Date: 2010-11-30 01:34:32 UTC
From: scotchmandr
Topic: 31964 Message: 31964

I attempted to use my 817 with Echolink and have the same problem with two 817s and a test 897. As soon as I hook up an external soundcard interface and plug into the mini-Din port I get noise on the Soundcard input/Mic line that is high enough to prevent use and even kick Echolink into permanent TX mode. Also, the volume out from the Din is not high enough and no squelching of FM.

So, I am tapping the Speaker Jack for Audio from the Radio to the PC. But to remove the noise on the Mic Line I need to take the Audio from PC to Radio Mic by tapping into the RJ45 plug on the Radio.

I want to make an adapter similar to the Mic-to-CW adapter by W4RT for the 8x7 series. And use the *x7 radio's built in VOX to handle the TX/RX switching. This concept works with my VX-7 HT.

QUESTION:

If I use a Stereo Jack; the Tip would be MIC, Ring is PTT, and Sleeve is Ground? Yes? Do I worry about Mic-Gnd pin? Or use the regular Gnd pin?

Do I need a resistor or anything added to the PTT line?

Any advice would be helpful, better yet is if someone else already has an adapter like this made.

The radio still transmits , but only puts out a couple watts .
Looking for a diagnostic tree for checking out ?
I've tested with Bird 43 & Palstar dummy load and it still makes HF contacts , just low power , about 2 watts ?
Thanks

Actually , I'm not sure , in the beginning I thought that it was a result of setting up a new antenna and the center conductor got grounded , RV mount to body of RV .
Then with all the checking out , I'm not sure that it didn't happen when I 1st got the radio , refurbished at the local radio store / candy store is what many call it .
About the same performance as I look back as always .

From: w4wb
Topic: 31913 Message: 31968

Folks,

Kindly halt this thread as civility is now lacking. Take it off-line (simplex) rather on the group.

The ARRL has a section on operating on 60m that may be useful to read. The page is at http://www.arrl.org/60-meter-faq# and see particularly the fifth FAQ entitled "But if USB is the only permissible emission, how can hams "tune up" on 5 MHz? That might mean putting out a carrier."

I have 2 w4rt packs that went bad while I was in a nursing home.
I haven't tried rebuilding them yet BUT I opened one up and by the size of them I would Guess that they are size 4/3A

Could probably get somebody like Batteries plus to stitch them together then transfer all the stuff from the old packs over.....

From: ab9df
Topic: 31971 Message: 31971

I have a 897d radio and my plug to attach my FT-Meter from LDG is not working correctly. My meter isnt working. If I wiggle the plug itself it will work if I am moving the plug. At first I thought I had a bad cable and replaced it. After replacing the cable, it still doesnt work. Now I think it is the plug itself. Has anyone else had this problem? Is there a fix to it without having to send the machine in? It just seems that the plug isnt making a good connection when plugged into the radio itself. Any advice??
Thanks! Rob AB9DF

sounds like the plug connection not making good. possibly poor soldering. the 2.5mm plug solder points on some plugs are not good esp if plug cheap version.

btw dont know why peeps buy the meter as good fun making one for fraction of cost.

Sounds like the 1/8th inch jack has a cold solder joint on the PC board.
Will require some disassembly. Then a touch up of solder on the leads. An
easy job as far as the soldering part, but I'm not sure about the
disassembly.

Good Luck de Patrick KI8UM

Hi Again!

Thank you very much people who have taken your time to reply to this
thread, now after having tried(again) a full reset which yeildet no change.
Checked the service menu, values looks fair(vhf 128), I found that after
a recheck, that also uhf is deaf! BUT only on FM and PKT, am / ssb is okay?

So I guess this leads me to the conclution that the signal path is okay?
Also checked the vco vcv voltages and they are okay(just for the reference).
Guess this gets more and more odd, hihi..

Anyone got a good idea?

> a recheck, that also uhf is deaf! BUT only on FM and PKT, am / ssb is okay?

Michael, the service menu value "128" scares me. That's what mine was
set to, also, after the glitch that caused the rig to spontaneously
reset, and apparently this is the "safe" value Yaesu stores there prior
to the rig's alignment. Are all your RXG values set to 128? (NO-001
to NO-006?) Is NO-007 / SSB-S9 set to something different? Did your rig
ever spontaneously reset itself? If so, you may well have suffered a
corrupted memory. OTOH, my UHF/VHF receive is not deaf, although I
haven't played around with them too seriously since my incident.

Good luck,
Rob

31983. HSWR on UHF ??????

Yahoo group: FT897 (2010)
Date: 2010-11-30 23:24:34 UTC
From: dodge
Topic: 31983 Message: 31983

Just connected my 897D to my discon antenna here at the base.

It indicates a very high SWR,(5:1) but all my other rigs using the same setup (Antenna, Switch, Meter, and coax) have little or no SWR.

Tried different ports on the switch, swapped cables between the 706 and 897. Power gauges and the 897 and external SWR/POWER meter both indicate 10 watts.

Menu 075 "RF POWER SET set to 20 (max for uhf)
Menu 051 "FM MIC GAIN" set to 40

Setup
FT-897D
FP-30 Power Supply
FC-30 Antenna Tuner
Heil Handi Mic with HM-5 element
LDG FTL-Meter (new today).

Frequency 444.xxx RX 449.xxx TX

Help Please.

> Tuning is not permitted on 60 meter channels.

Dan (et. al.),
I don't wan't to get into a flamefest over this, but the regs for 60m do not address "tuning". They only address modes of operation.

Below is a snippet from the ARRL's 60-meter FAQ, which can be found in its entirety here: http://www.arrl.org/60-meter-faq

"But if USB is the only permissible emission, how can hams "tune up" on 5 MHz? That might mean putting out a carrier.
...
Most automatic tuners do require briefly transmitting a small amount of carrier over the air. Not recommended but probably legal (as long as you're not interfering with other stations) would be the tried and true "whistling" or "hellllllooooo" methods."

I will also point out that antenna analyzers are no panacea. They work by injecting a small RF signal into the antenna, too.

Reasonable people may disagree on the interpretation of the rules, and if you believe a whistle is contrary to the rules, by all means don't do it.

These are my final comments on this matter here,
Rob / KD8WK

the tuning they talked about was for antenna tuners not for tuning the radio. The FCC states the occupied bandwidth is limited to 2.8 kHz centered on 5332, 5348, 5368, 5373, and 5405 kHz. Most radios however display the carrier frequency (which is suppressed in USB mode). This means that you have to tune so the display reads 5330.5, 5346.5, 5366.5, 5371.5, 5403.5 respectively. IIRC one frequency was to be changed, I do not use 60m so I do not follow it that much, before actually transmitting you may want to get something more authoritative.

The antenna tuning method some people use is to zero beat a CW transmission on the desired frequency (so no tone is heard by everyone else) or setting to AM and disrupting any existing QSO on the given frequency. 60m only allows USB phone and nothing else so alternate methods of tuning must be employed to avoid running afoul of FCC rules.

From http://www.arrl.org/60-meter-faq
"A dummy load would be the device of choice for "tuning up" on 5 MHz, especially since many users will be attempting to transmit on a channel that's already got some activity on it (you wouldn't "tune up" on the local repeater input, would you?)."

This however is the stupidest thing I have read about radio. If you disconnect your antenna and connect a dummy load you will be tuning the dummy load not the antenna. When you swap back you will still not be tuned.

In that FAQ they do suggest that it is "probably legal" to key up and whistle or say hellllooooo, whistling however is not that good of a tuning method as its variable. Both methods create QRM and could cause issues for others already using the frequencies. They are also transmissions not intending to communicate and could run afoul of FCC rules for that purpose (although odds are, and thus the "probably legal" comment, no one will complain, people not complaining however does not mean its "probably legal").

Basically if your tuner requires a carrier to tune you are boned, there is no legal way for you to tune. If your tuner can tune while you talk on USB then you can do that and it might even work well for you.

31990. Re: Rebuild 897 internal battery?

Yahoo group: FT897 (2010)
Date: 2010-12-01 03:34:11 UTC
From: Clark
Topic: 31910 Message: 31990

Thanks! Yes, they're 4/3 AF cells. I went on line and found that the two places (batteries plus was first) that will rebuild them need about 90 bucks to do it, but I can get discounted batteries for the 897 for that price. So I'll either buy those (at 90 each) or attempt to rebuild myself (for about 60 each, and some risk that I don't get it right!)

I'll probably wait a bit on this.

That was my reaction when I first read it as well; however, after a little reflection I thought that they were probably referring to tuning the "tank" circuit of a tube final amplifier, where that might be a reasonable technique. However, 99.9% (and maybe even more) of amateurs have solid-state radios, where tuning into a dummy load doesn't serve much (if any) purpose. I agree with you; I think the ARRL's page on this subject needs to be updated ...

> In that FAQ they do suggest that it is "probably legal" to key up and whistle or say hellllooooo, whistling however is not that good of a tuning method as its variable.

With the FT-897 and the MH-59 microphone, press one of the digit buttons to generate a two-tone DTMF signal. This works in all voice modes. Sadly, the FT-897's capability of generating a 1750Hz tone only works in FM mode, and ANY *modulated* transmission on FM in this band will certainly violate both the letter and the intent of the regulation!

Question to Riley Hollingsworth, *FCC legal counsel for amateur radio enforcement* on 2005-07-01:

/"My interpretation of §97.305(b) is that a brief (2-3 seconds) transmission of a carrier (WITHIN the 5MHz channel) is allowed for antenna tuner adjustment."/

His complete written response on 2005-07-01 (quoted subsequently multiple times on this forum):/
/

/"I don't see a problem with it."/

After that, followed a "healthy" discussion of what constituted a permitted signal and what constituted a "carrier". Put simply, there is MUCH CONFUSION in amateur radio about this subject; Yaesu had to publish an FAQ on their web site on the use of 60 meters with the FT-897, because some amateur went off half-cocked and on multiple web sites, posted messages accusing Yaesu of having the wrong frequencies programmed into the radio !!! Few amateurs apparently understand emission modes, not to mention the signal characteristics (eg, physics and mathematics) of each. I plan to do a web page soon on this subject, with RF FFT images from my 'scope.

For example (Bret, I'd guess you already know this stuff):

1. What is a single frequency emission? Is it CW (mode N0N), unmodulated AM (Mode A0N), unmodulated FM (F0N), or a (yet to be determined audio frequency) SSB (mode J3E) tone? You can't tell* until there are other signals to put the emission "in context".

2. What is an emission that consists of two frequencies, 1kHz apart, with one twice the amplitude of the other? Is it DSB (suppressed carrier), or an SSB (w/ carrier) single tone, or SSB (w/o carrier) two-tone (audio frequencies undetermined)? You can't (yet) tell*.

3. What is an emission that consists of three frequencies, 1kHz apart, with the middle one twice the amplitude of the others? Is it AM single tone, or an SSB (w/ reduced carrier) dual tone, or SSB (w/o carrier) three-tone (audio frequencies undetermined)? You can't (yet) tell*.

Once someone starts to transmit intelligence (eg, voice or data) in any mode, the mode usually becomes instantly obvious.

Which brings us to the *intent* of the regulations on this band:

1. Keep all emissions within the channel. This obviously includes tuning!

2. Be listening in USB, so that you can hear any request to get off the frequency.

3. Communicate and identify yourself in USB, so that listeners can contact you if necessary.

Sincerely, Dean AE7Q

ps: *To quote from my infamous message on 2005-07-02:

/If [anyone] claims there is a difference, tell us how ANYONE monitoring the signal can tell the difference. For the purpose of this question, assume that the entire radio monitoring capability of the US Gov't (FCC, military, CIA, and NSA) are sitting right outside my house with the most sophisticated monitoring equipment available, ready to pounce when I transmit a N0N, F0N, or A0N emission instead of a [single tone] J3E emission. However, they are not allowed to

use mind readers, telepaths, or aliens./

I don't write all this every time the subject comes up to be sarcastic, but to make a point: The reason I write it, is that many amateurs are in effect scared away from using 60 meters. There is no reason to be scared; just be careful.

From: Rob Stampfli
Topic: 31992 Message: 31992

But, first, a minor deviation to comment on another topic:
=-=-=-

some RF into the CAT cable, causing some bogus command to be injected?

Have you ever done anything to provoke such a power-on reset in your testing? If so, what, if anything, did the reset wipe out of your service menu items?

What type of nonvolatile memory does the 897 have? Is it really an EEPROM or is it some NAND variant?

Your memory map seems to cover the service menu items plus the rig's operational settings (menu and function settings). Are there any other controllable items in the nonvolatile memory layout?

Where is the rig's firmware program located? Do you know if it's possible to update the firmware on the rig via the CAT interface?

Where did you get all your information about the CAT interface, such as how to dump a memory location? The 897's manual contains one page with only a few of the CAT commands documented on it.

Once I get the rig over to a friends' to be partially "re-aligned" so as to repopulate the correct service menu values that were reset, I'd like to make the changes I prefer to the regular menu items and save the state of the entire non-volatile memory. I see you have a memory dump program. Is there a program to upload such a memory dump back into the 897 in case this problem recurs?

Finally, do you know if this memory is shadowed elsewhere in the 897? One of the oddball things I noticed after my glitch was that the displayed voltage was wrong. It read consistently a couple 1/10th of a volt low. I went into the service menu and changed the voltage to 14V, saved it, reset it to 13.8V and resaved, and then it read 13.8V on the display once again, and I'm curious as to why this would be the case.

Anyway, thanks in advance for any insight you can shed on this,
Rob / KD8WK

> I am running the USB cable through my LDG AT-897Plus. The baud rate is 4800.
> I'm not sure if the radio alone will use this baud rate, but worth a try.

Yes, the AT-897Plus requires the CAT interface on the radio to be set
to 4800 baud. However, if the serial port on your computer (or USB
cable) is also set to 4800 baud it can talk to the radio fine at that
baud rate, even reasonably well (but not perfectly) after it is chained
through the 897Plus. (You may have to fool around with setting DTR or
DSR -- I remember having to set one to make it work, but I forget which.)
In any event, 4800 baud is plenty fast enough for keeping HRD happy.

YMMV,
Rob / KD8WK

is that legally binding? I ask because the IRS can give you advice on tax matters and if they are wrong you still get punished. Their advice is not legally binding even if you have it in writing. Then there is the situations where state attorney generals have written letters stating their opinion of a gun transport law, and when someone followed that advice, exactly as written, the attorney general changed their opinion and charged the person. Their opinion was not legally binding even though they are the one that brought the charges against people (I can think of a specific instance in California where this exact thing happened).

AFAIK, and IANAL, the only binding opinion that matters would be a FCC rule which would have a NPRM written up beforehand.

With that said, most infractions of ham radio rules go unpunished, people do not report them (ham is self policed after all) and most people do not care. Sometimes it is innocent, noise in the background that violates a rule, discussions that drift towards music and someone sings to make the song they are talking about known, rebroadcasting a TV/Radio that is accidentally picked up in the background, language especially late at night, failure to ID every 10 minutes, or even intentional stuff which I have heard more than once especially on certain HF frequencies. I doubt that it would be reported let alone enforced if it is specifically for the purposes of tuning the radio and no longer than absolutely required.

I think this is another issue where the FCC needs to make a clear rule on this so that it is binding. It is similar to some nets that occur across national borders, most violate some rules of ham radio yet no one cares, wants to care, or even reports it and if reported I do not think the FCC would enforce, but a rule allowing such activities would prevent potential selective enforcement against individuals that for whatever reason are targeted. The FCC did such selective enforcement of one ham where they went after him merely because he did not change his address but instead left it at his mothers house. This shows that they are willing to do selective enforcement on some issues, and that would be a

fear I have when it comes to their rules and non-binding statements made.

I can see that since the FCC publishes the SSB frequency and Yaesu radios display the (missing) carrier frequency. Most radios display the carrier frequency, which is why the ARRL publishes both in their band plans and other places.

I think, although I may be wrong, that the general test has questions relating to 60m and what frequency is displayed vs what is actually transmitted. This would indicate that it is a problem large enough that they want to be sure people know this information.

> /If [anyone] claims there is a difference, tell us how ANYONE

well there are ways to monitor what frequency a radio is tuned to, although proximity is a key factor in that. This would work even if the radio is in receive only mode and not transmitting. While this is by no means new (the FCC was threatening to drive around looking for people monitoring cell phone communications back in the 80s) more recently (10 years ago) there was a commercial device that would do this as you enter a stadium to know what frequency your car radio was tuned to so they know where best to advertise for similar events. The tuning circuits give off a weak RF signal that can be detected and the frequency generally known despite any multiplier that is used to mix with the signal to pull it out.

By knowing what frequency you are tuned to when you key up they can identify some of what that signal is :) Would they? most likely not. Would they even care most of the time? probably not (especially if you drop to 5w to tune and do not rely on the radio auto-adjusting power downward until tuned). If its just to tune my guess is that while it breaks the rules, if it is as short as possible and low power it will be ignored.

I dont use it because all I get on the channels are commercial data from I think maritime sources. I have never made contacts on the band and trying to hear someone over this noise (which is authorized noise so I cant complain about it) is nearly impossible. I think this was so problematic that the ARRL petititoned the FCC to change one of the frequencies because it is always used for almost everyone by a primary license holder for such data transmissions. Never read (or cared) if that got changed. If it does change getting that fixed in the 897 would require sending the radio to Yaesu for a reflashing.

31995. AT-897 won't tune

Yahoo group: FT897 (2010)
Date: 2010-12-01 06:50:02 UTC
From: ke7adu
Topic: 31995 Message: 31995

Today I received the refurbished AT-897 I ordered from cheapham.com. I carefully followed the instructions to install the unit to side of my FT-897D and then attached the cables per the diagram in the manual. Installed an antenna and pressed the tune button. Nothing happened. I checked Menu items 19 and 20 and set the unit to 4800 bps and CAT. The 897 was set at 9600.

I pressed tune again for several seconds and still nothing happened. I power cycled the unit, double, tripe and quadruple checked the cables and I am convinced they are correct. My antenna is resonant on 160 meters so I tuned in a few QSO on 160 with no problem with the tuner in line. I also tried tuning on several bands I know require matching with my AT-1000.

Has any one seen this yet? Suggestions or just DOA. I am thinking DOA.

Thanks,
Anthony
AE7HS

My understanding has always been that's incorrect. However, I did some (Google) research after your response, and apparently, "it depends"; see http://www.irs.gov/retirement/article/0,,id=218539,00.html

IRS "opinion letters" are generally given for retirement plans, and the letter may not be binding if the letter was used in a way contrary to the facts presented in the request, or in some other manner where the letter was used in an unanticipated situation.

I think the FCC case is similar. Clearly if you used the FCC response to characterize CW as a series of "tuning transmissions", even if you listened in USB mode, that would be an unwarranted usage of Mr. Hollingsworth reply. However, if you truly do brief tuning transmissions well within a channel, and identify with voice afterwards, I think you would be fine. I think the "reasonable" test prevails (as it does in almost all legal situations). Again, I think the intent is that you remain within the channel and communicate w/ USB voice so that you can be easily identified and asked to terminate operations if necessary.

Perhaps it would be nice if the FCC spelled it out in a rule, but notice that the word "tuning" or "tune" doesn't even appear in the part 97 regulations; the closest we come is §97.111(b)(1) [station adjustments] and §97.305(b) [test emissions]. Most everything else is left to "good operating practice" (§97.101(a) and §97.307(a)). I think that covers it quite well *...*

> some RF into the CAT cable, causing some bogus command to be injected?
>

it could be anything, there are many things that could cause that. The first two bytes on the external eeprom are a checksum. Not so much a checksum in the traditional sense, but a "magic number" that indicates the contents are what they are supposed to be. in hex it is A55A, in binary it is 1010 0101 0101 1010 so you get a good bit spread.

As for RF into the CAT cable causing a bogus command, it would take quite a bit to make that happen. The RF would have to cause a bit error at just the write time. Further, unless it is doing multiple bits while preserving the CAT/RS232 framing, it is unlikely that this would happen. For example to write 0x00 0x00 to the first two bytes of the eeprom (all writes are 2 bytes at a time) you would have to issue
0x00 0x00 0x00 0x00 0xBC

Anything else would not invalidate the entire eeprom (and I do not know that this would, but its the best guess if anything could). Since all CAT commands are 5 bytes long you would either have to send all 0s and the RF overwrites the 0xBC part to something that would be valid for 0xBC or whatever.

The voltages used on RS232 are +/-12V although some devices are +/-5 and +/-3 volts. The RF would have to cause at least a 3 volt shift (what the receiver is required to detect). The start bit is high, stop bit is low, a 1 is low a 0 is high. A low is the low voltage setting not 0v. This means for the stop bit and the 1s in binary that are sent the RF would not need to be there, additionally the computer would not be sending at that time, or sending a low signal at that time.

The odds of this happening are fairly low.

> Have you ever done anything to provoke such a power-on reset in your
> testing? If so, what, if anything, did the reset wipe out of your
> service menu items?
>

nope, nothing that I did not intend to do was done. Never had an error with it. A full reset will reset the alignment data, there is a CAT command to do that (undocumented) but that does not render the radio unusable it just renders it with 0 memories and 0 alignment data and everything else "factory fresh".

> What type of nonvolatile memory does the 897 have? Is it really an
> EEPROM or is it some NAND variant?
>

It is an I2C eeprom, I forget the model right now but its on my page somewhere. The CPU has an internal eeprom for the firmware and it natively speaks I2C so it is a straight forward connection. The external eeprom holds the alignment data, jumper data (firmware prevents just tweaking these values on newer models), memories, etc.

> Your memory map seems to cover the service menu items plus the rig's
> operational settings (menu and function settings). Are there any other
> controllable items in the nonvolatile memory layout?
>

There are a couple values that appear to be read in realtime, so a write will cause the radio to change functionality. There are also CAT commands (some undocumented) that let you cause the radio to do certain tasks.

> Where is the rig's firmware program located? Do you know if it's
> possible to update the firmware on the rig via the CAT interface?
>

The firmware is in the CPU, the CPU has a 128kB eeprom for the firmware. Jumper J1010 iirc is the one that is set to let you flash, but the CPU will erase what is there, then load a program from that connector and run the program. That program is supposed to be a loader program that will reflash the chip. Be warned that chip's internal eeprom only has 100 writes.

There are other ways to gain access to that eeprom though, unprotected ways where you can just bitbang a full read/write to the eeprom allowing for dumping, tweaking and reflashing. A "bus pirate" can be used to do this. The cpu is only like $5 or $20 (I forget which, its cheap either way) so replacing it is not difficult, http://www.chipquick.com makes it easy to desolder the chip with a regular stick iron then you can put on a socket for future upgrading. Not recommended for the faint of heart, if you dont really know what you are doing its easy to mess things up.

> Where did you get all your information about the CAT interface, such
> as
> how to dump a memory location? The 897's manual contains one page with
> only a few of the CAT commands documented on it.
>

trial and error, work of others, etc. CAT has a fixed byte format and
an error code for unknown commands. This means that it is not difficult
to write a scanner for it. I have such a scanner written as well. Once
you know that there is a command you have to look and figure out what it
does, there is one command I know about that I have no idea what it
does. All values sent appear to do nothing, at least nothing obvious.

> the state of the entire non-volatile memory. I see you have a memory
> dump program. Is there a program to upload such a memory dump back
> into the 897 in case this problem recurs?
>

no but its trivial to write such a program. I have a perl module that
is used for the dumping tool, you just have to read a file and then
write the values. You will write them 16 bits at a time.

CAT command 0xBC will write. You send:
MSB LSB DATA1 DATA2 0xBC
MSB/LSB is the most significant byte/least significant byte of the
address. DATA1 and DATA2 are the 2 bytes you want to write.

The perl module uses $radio->writeEeprom() to make it easier.

> Finally, do you know if this memory is shadowed elsewhere in the 897?
I have not found any place that it is, its on the eeprom and that
appears to be it.

> One of the oddball things I noticed after my glitch was that the
> displayed
> voltage was wrong. It read consistently a couple 1/10th of a volt low.

Are you certain it is wrong? There could have been a component failure
before where it reads the voltage so what is input is not what is read
after it passes some of these components. That may indicate where a
failure occurred that caused the problem in the first place.

that is not what I was referring to, what I was referring to are the people that called/wrote the IRS asking questions and were given bad info and then ended up having legal difficulties. That is also not that relevant to the issue at hand, I offered it as well as the state Attorney General comments only to illustrate just because someone "official" says something does not make it binding.

I really dislike selective enforcement, and generally try to avoid being in situations where that can be done to me. To that end I would love to see a FCC rule specifically allowing non-USB based tuning on 60m, however I will stand behind my belief that if its short duration, just for tuning, etc no one will complain and the FCC will not investigate if anyone does complain (unless they are targeting you specifically like they did with the ham operator whose address was at his mothers house previously mentioned, he was not targeted for anything he did on the radio either).

I had several problems with this tuner. I used some home made cables with no marks on the connector.
If you put the tuner end of the Y-ACC cable into the transceiver, and the transceiver end into the tuner, the tuner won't work. This cable is cross linked, and uses different contacts of the stereo 2,5mm plug.
So maybe you could re-check your cables again.
If everything fails, and you connected the cat cable properly, main power must be on the circuit, and pressing the tune button for 2 seconds must make the tuner reset, and perform a full scan.

Subject: [FT897] AT-897 won't tune

Today I received the refurbished AT-897 I ordered from cheapham.com. I carefully followed the instructions to install the unit to side of my FT-897D and then attached the cables per the diagram in the manual. Installed an antenna and pressed the tune button. Nothing happened. I checked Menu items 19 and 20 and set the unit to 4800 bps and CAT. The 897 was set at 9600.

I pressed tune again for several seconds and still nothing happened. I power cycled the unit, double, tripe and quadruple checked the cables and I am convinced they are correct. My antenna is resonant on 160 meters so I tuned in a few QSO on 160 with no problem with the tuner in line. I also tried tuning on several bands I know require matching with my AT-1000.

Has any one seen this yet? Suggestions or just DOA. I am thinking DOA.

Thanks,
Anthony

Anthony, if you are talking about the AT-897 (and not the AT-897 plus), take in account that it uses the CAT port of the rig not for communication purpose, but just for taking the needed power supply (see the manual, CAT port, 13.8V and GND pins), so doesn't matter what is the value in the menu 19

If the ATU doesn't work at all, it may be that is not powered.
Did you check whether 13.8V are present on the CAT connector?
If not present, maybe the internal fuse inside the rig is blown. It could happen if you plug/unplug the CAT connector when the rig is powered.

Take a look here:
http://www.webalice.it/brugneraivo/i6ibe/897/ft897.htm
the site is in Italian, but in the third and forth images you can clearly identify that fuse.
It is a SMD component, but you can easily replace it with a small enough different type, use 3.5A.

Hope this is helpful

That's interesting. I view the service menu items (alignment data) as being necessary for the proper functioning of the rig -- every bit as critical to its operation as the proper adjustment of the components on the circuit board itself. I'm surprised Yaesu would allow them to be lost via a simple CAT reset command. But, in retrospect, the EEPROM data does seem rather fragile to me. It would have been nice if Yaesu provided a printout of the service menu parameters with the rig, from when it was aligned at the factory. Of course, my problem may be a real outlier, but it would save me a lot of grief if I could simply just reprogram the glitched values instead of having to put the rig on the bench. I'm definitely keeping a copy of what I put in when I re-align the rig. Of course, it's 20/20 hindsight not to have dumped them when I first got the rig, but I just wasn't thinking of them at that point; wasn't even aware of them until later.

I've actually seen someone assemble the circuit board for a SMD Softrock Radio in a fry pan. It was an amazing thing to watch.

I may indeed look into that. It would surely be useful in the event this glitch recurs.

I just found it odd that, after the glitch, the quiescent voltage readout on the display was 13.5 or 13.6V. Service menu item 016 (VCC) was still set to 138. I went in and bumped it to 140, and then the voltage readout then read 14V on the display, so I went back in and changed it back to 138, after which the readout then correctly read 13.8V. I found this odd. The only explanation I could come up with was that something other than the EEPROM was being affected by modifying the VCC value. And, on thinking about it a moment, I believe this must be true, since you can immediately see the results of modifying one of these values, but it isn't stored to memory to survive a power cycle until you hold down the F key for a couple seconds.

YMMV,
Rob / KD8WK

Messing in the service menu is a REALLY BAD IDEA. FOR EXAMPLE, when you set service menu 016 to a particular value, what you are really telling the radio is that the voltage that is currently applied to the radio is that voltage. THEN, the radio carries out an internal calibration of the voltage, so that the voltage will read correctly as it varies.

What this means it that, whenever you SET service menu item # 16, then that value will ALWAYS read the last value you set it to, regardless of the actual voltage.

Go back to the service menu and precisely measure the voltage applied to the radio. THEN, set service menu # 16 to that value. Then, the radio will correctly display the applied voltage.

Then, I would strongly suggest leaving it alone.

Dean, I would love to leave the my service menu items alone.
Unfortunately, a glitch in the radio caused many of them to
be reset to default values. After the glitch, the displayed
voltage dropped from 13.8 to around 13.5, even though the
supply voltage was indeed 13.8V. I went in, re-saved 138 in
the proper service menu item, and the voltage again displays
correctly. How would you suggest I handle this situation
differently?

When I got this radio, I told myself that I was never going to
mess with this data, so I left it alone. I never even went
into this service menu to examine what was there. Now, I
fervently wish I had done so, and copied down all the values.
If I had, I could simply reprogram them and be back to the way
I was before the glitch. Given my experience, I would personally
encourage all FT-897 owners to make a copy of this data for
future reference, but to each his own.

Well, There's always sending the radio to Yaesu, and in fact that's what
I'd do (and I have a complete memory map of the radio's settings, and
decades of experience in working with embedded systems and writing
embedded systems software). Or, I'd buy the service manual, and then
have some confidence that I was doing the right thing. Frankly, I'd
rather it be done right, by someone who did the adjustments for a living
and had the right tools.

> If I had, I could simply reprogram them and be back to the way I was before the glitch.

Except for at least #16, which you can't just set back to 138; you have
to follow the procedure I mentioned. I don't know whether any of the
other service menu items initiate calibration procedures rather than
just be settings.

> Given my experience, I would personally encourage all FT-897 owners to make a copy of this data for future reference, but to each his own.

I'd agree with that, with the caveat that you can't just reload them*.*

Actually, I have the service manual, and all it says about VCC is "Confirm that the supply voltage is 13.8V (+/-.1 V). Select menu item 17:VCC and adjust this parameter such that 138 is displayed on the LCD." That's what I did. To reiterate, I was just surprised resetting this set point from 138 to 138 would make a difference, but it did. And, thus I learned something else about the rig.

BTW, VCC is menu item 17, not 16. In looking down my list of recorded values earlier, I think I misread it.

Reading through the service manual is quite interesting. More and more, radios are relying on software as a proxy for tweaking real components to align the rig, and it's interesting how they actually perform some of the alignment procedures. But software set points have both positives and negatives associated with them, as I have seen.

Initially, I thought the radio would have to go back to Yaesu. However, after some investigation, I'm not so sure. I'm now optimistic the problems may likely be resolved via software adjustments, which I can do myself. I have friends who have the necessary equipment. And, not much beats the feeling of ferreting out a solution to a complicated problem and resolving it with one's own hands.

The way I figure it, I've been given an opportunity to learn something new about the radio. In the worst case, it has to go to Yaesu for servicing, and I'm no worse off than if I hadn't tried. Perhaps no one here but me is interested in this thread, but I figure it will go into the archives and perhaps be of value to someone else down the road some day.

32009. Re: AT-897 won't tune

Yahoo group: FT897 (2010)
Date: 2010-12-02 07:33:02 UTC
From: ke7adu
Topic: 31995 Message: 32009

I did some testing tonight and I think this may be part of the problem. I inserted a small pin and measured the voltage and got 13.8 volts. I then hooked up the cable and measured 13.8 at the tuner end of the cable.

I connected the cable to the at-897 and still no red light or tune but when I rechecked the the voltage at the cat jack it's now .02.

I guess will have to see of I can find a replacement fuse. I am still not sure that will fix the problem though since I had 13.8 volt to begin with and plugging in the cable likely popped the ant fuse,

Looks small hope I can solder it. I think removing it should be easy but replacing it... Well that a different story.

I'm sorry for that, it looks like your fuse was ok and it blew during the plug/unplug operations
Anyway, as the fuse is now open you don't need to remove it, just add a new one in parallel. You can chose a bigger one, easier to mount, with dimensions as a 1/4W resistor, as shown in the picture from the I6IBE's site.

As soon the CAT socket become again operational, I would suggest to test the ATU separately from the rig: just connect the CAT cable to the ATU and to an external power supply, only the 13.8 and GND pins need to be connected to the PS, so you can check if the ATU reacts.

The FAST button on the mike will power up and power down the FT-897D.
You take a parallel port signal in to a one shot multivibrator so it toggles low for about 100ms and the power will go on and go off. I have a mike breakout box that switches from the local mike or to the PC and I just pull out the FAST button lead to the one shot.

Just to share my cheap solution for power-on/off to save unnecessary power consumption. get a timer in the hardware store, program it to make sure it is powering on when you like to operate your rig, connect to the AC-DC power supply of your radio and here is the timed power control and will automatically turn on and off daily...BM2JAM, Taiwan

Hmmm,

I wrote LDG and they respond that "it is highly unlikely that the at-897 is DOA". I have been happy with my other LDG products so I hope I can work this out. It seems to me that the tuner likely blew the fuse on my rig and has a problem.

I have ordered a five pack of 3 amp pico fuses. Don't really want to spend the cost of the tuner on repairing the radio.

I will let the group know how it goes. Thanks for the help.

Dear groupmembers
I am using the AT897 plus and no problems.
I know from hams using a old 897 version they had the same promblem
and have to change the menu of the set in 5 Watts AM to tune.
Using my ATU the first time I did it also and later by full power the menu went automatic into 5 Watts AM
Thet fact also is that using the ATU the first time people do forget to change the CAT-menu into 4800 baud because the set is automatic delivered by Yaesu in 9600 Baud

32022. RE: [FT897] AT-897 won't tune

Yahoo group: FT897 (2010)
Date: 2010-12-04 17:19:39 UTC
From: Mike Ernst
Topic: 31995 Message: 32022

Anthony,

Two things - in order for the tuner to tune, it must be able to switch the FT897 into transmit mode. So my guess is that is what is not happening. That is where I would focus. Check the cable associated with that function (the manual states Connect the Y-ACC cable. Plug the red end marked "Radio" into the radio's ACC port. Connect the black end marked "Tuner" into the tuner's interface jack marked "OTT".) If that cable is not making good contact the tuner will not work. I had a fellow Ham whose unit was doing the same thing. Turns out he had not pushed the 3.5MM plug fully into the socket. On my unit I built a small external device that switches the Transceiver into transmit at 5 watts. It plugs into the ACC port on the rig and the red wire above gets omitted. This little device has a toggle switch to kick the unit into transmit, and if I forget to flip the toggle switch, my tuner does not work either.

Also, some of the mini din plugs rubber outer jacket is slightly larger than the mating female socket on the transceiver. Make sure they all seat well. (I had to use some sand paper and shave mine down slightly.)

Hope this works out for you.

73,

Mike Ernst, AE8U

Subject: [FT897] AT-897 won't tune

Today I received the refurbished AT-897 I ordered from cheapham.com. I carefully followed the instructions to install the unit to side of my FT-897D and then attached the cables per the diagram in the manual. Installed an antenna and pressed the tune button. Nothing happened. I checked Menu items 19 and 20 and set the unit to 4800 bps and CAT. The 897 was set at 9600.

I pressed tune again for several seconds and still nothing happened. I power cycled the unit, double, tripe and quadruple checked the cables and I am convinced they are correct. My antenna is resonant on 160 meters so I tuned in a few QSO on 160 with no problem with the tuner in line. I also tried tuning on several bands I know require matching with my AT-1000.

Has any one seen this yet? Suggestions or just DOA. I am thinking DOA.

Thanks,
Anthony

HI Again.

Sorry for delay in answering your post in a timely fashion..

I have never had any kind of issue with this rig, no resets no "weird" happenings it's just kept going and going until now.

All of the settings regarding rx g values are set individually, so no indication what so ever of an reset, I checked most of my values against the lists of settings I could find on the net from other amateur rig's, and it all looks valid..

I'm afraid I'm come to an dead end here, the fact that the sensivity seems okay when using ssb kinda spooks me..

32024. Re: PK-232MBX muting FT-897D audio

Yahoo group: FT897 (2010)
Date: 2010-12-05 20:10:29 UTC
From: Hank
Topic: 31808 Message: 32024

The problem was definitely the cable. The new cable works and doesn't cause unusual problems.

I am now having problems connecting though. The PK-232MBX keys the radio, and it tries to connect (using paclink for WL2K), but then disconnects and says "Retry Count Exceeded". I am using the data port, not using digital vox, and have the digital gain set to 60. Do these settings sound right for packet through a PK-232MBX?

Thanks,

Hank Lambert

I think you mean that you are connecting the data port of the FT-897 to the normal input connector of the PK-232.
The same PK-232 port you used for the amplified signal from the external speaker output of the rig.
The PK-232 needs an amplified signal, and can't be fed with a line out signal at that input. So I think that's the problem with the PK-232 and the packet connection on the back of the rig.

What language is this post in? English?
Well, I think the most of it is...

Hank,

I'm not familiar with PacLink. I think you are on HF, but I can't say for sure.

If it is FM, I believe 60 would be too high for your data gain. You can't overdeviate and expect it to work too well. Perhaps the same problem exists with sideband.

I would try reducing the gain to about 35 or 40 and try again. If you have a receiver you can use to hear yourself, it would help immensely. Of course, a portable receiver would help to see if you were putting any modulation out at all.

Thanks for the reply. I have it mostly working right now. I bought a pre-made data cable from Buxcom and it is now controlling the FT-897D. I still need to adjust the deviation and I think I will be in good shape.

32029. 500 CW FILTER FOR FT-897

Yahoo group: FT897 (2010)
Date: 2010-12-06 23:34:01 UTC
From: Fery
Topic: 32029 Message: 32029

A strange thing happened recently to me. From a representative in Romania of a Hungarian equipment seller I ordered the YF-122C 500 Hz CW filter for my FT-897 Yaesu Vertex transceiver. When I tried to plug it in the slot I noticed that the filter board is about 1 mm. too short! It was impossible to fit it in both the upper and lower pins.
On the box it was printed allright YF-122C, but on the filter itself was XF-115C. I returned the filter to the seller and I tried to explain my problem. He contacted the mother company in Hungary and he received the explanation that the two filters are actually the same and the filter should fit to my rig, since it was sold to many other 897 owners, without receiving any complaint. They will refund me the price, but not the shipping expenses...
I googled the XF-115C and I found out that it is recommended for FT-1000MP and FT-847, nut it works also with FT-897. But why this filter didn't fir with my rig?
Have anyvody experienced something similar? Thank you for your attention.
Francisc Grunberg, YO4PX

This is probably not an answer but maybe of some help. You can run the rig while looking/probing the backside of the Main unit. I've been doing it for a week while trying to troubleshoot a different problem. Remove all screws from PCB. Remove speaker connector. Carefully flip the board 180deg toward you and rest it on the front bezel. Pay attention to the white ribbon cable connector; there is enough slack to allow this but treat it gently. Place some sort of insulating material under the board (component side) where it contacts the bezel and frame. I simply used some paper. Important: fab a heatsink for the 8v voltage regulator (3 terminal device on right side as you're looking at it.) I used 2 inches/50mm of alum sheet bolted thru the regulator with a small screw & nut. The alum strip hangs out in air to the right. That regulator gets HOT and needs a heatsink when it's not bolted to the frame.

Another thing to consider - my VHF/UHF connector went bad. I found I wasn't hearing anything on VHF/UHF until I discovered that the internal contact in the SO-239 receptacle wasn't making good contact. But if you're transmitting on VHF with good swr then this probably isn't your problem.

Good luck,
dale KD7UO

Date: 2010-12-04 21:32:46 UTC
From: qdh123
Topic: 32031 Message: 32031

Hello Group
I recently fixed the dreaded "static crashes all bands all modes no antenna" problem on my 897. I replaced CF1005 AM filter, along with CF1002 & CF1003 FM filters and some of the switching diodes nearby. (Absolute torture, let me tell you!) The good news is this solved the continuous +S9 static crashes that is a common problem as has been discussed many times in the Group. The bad news is my S-meter is not right. When the rig powers up the S-meter starts at S8 and within seconds moves to S++ (max'd to right) on all bands all modes with or without antenna. The rig is working fine on Tx and Rx. I'm hoping someone with some circuit familiarity can help me troubleshoot the the S-meter circuit. I'm guessing it's driven by the AGC circuit, probably in the Q1099 area. This sort of makes sense since it's right after the filter circuits where I was performing microsurgery. Either the S-meter driver was also bad or I messed it up while fixing the filter problem. Another hint - squelch works for FM but no longer works for other modes. I don't really know the details of how the AGC works and thus don't know what to look for on the oscilloscope. Any advice would be welcome.

Hi,
To date, I've always used a standard issue mic with my 897. However, I would like to start using a headset and footswitch (as I do with my main HF rig.

Can anyone recommend headset and 897 settings combination that would work well on FM (I use it mainly on 2m & 70cm nets).

I've got the Heil Pro Set HC4 for my HF work, how about the HC5 for 897 and FM - anyone got any thoughts, please?

Many thanks

Hi Barrie

The £10 cable connects your radio to your computer so that you can control it with software such as Ham Radio deluxe or Logger32. The £35 cable is an interface so that you can use digi modes such as psk or RTTY.
So if you want to use your 897 for digi modes you will need both. I have both and they work fine. Although I have only used them when out portable (see http://www.g6tw.co.uk/gm6tw.html). I have found that I have some rf breakthrough into my laptop when using the soundcard interface, which I do not get when I use the much more expensive Tigertronics signal link.

Hope this helps

are you doing packet if so there is a a different pin for 1200 baud and 9600.
I have transfered a 18 k file from the ft-897 to a ft-8800 in 42 sec. I use the 6 pin mini din on the back of the rig works great.. also if you invest in a 6 & 8 pin mini male to female you can leave them pluged into the rig and change things without moving the radio..

From: Hank Lambert
Topic: 31901 Message: 32036

Ham Radio Deluxe is a very powerful radio-control program that is free. It also has a lot of add-ons such as digital modes and satellite tracking. It only runs on Windows and has a huge community support forum. It can be a bit finicky with some people, and upgrades can also be problematic sometimes. I have a very old version running and it runs great. I have opted not to upgrade because of the upgrade problems some people have.

Another free option is fldigi. It runs on Linux, Windows (OS X), and Macs. It is not as polished as HRD, but very light weight and stable. With fldigi, you select what you want it to do with the appropriate plug-in. Therefore, if you don't need a certain feature, it isn't installed and running on your system. I use fldigi on my Linux systems and it works great. I will probably migrate to it on my Windows system as well because it is so fast.

There is also FTBCAT, which is commercial software by G4HFQ software. I personally have not used this software, but I do use some of his other software and it is excellent. Also, his tech support is some of the finest in the world. If you are having a problem that he can't help you with via email or the Yahoo group, he will schedule a time and call you and help you get it working over the phone.

I suggest you try out each one and decide which one is a good fit for you. Everyone has different needs, and these three programs offer different solutions.

Subject: [FT897] UHF Amplifier

The 897D's maximum output wattage on UHF is only 20 watts (at max) and it is just barely adequate to make it to a local repeater when there is a lot of traffic. However, it has been something I've lived with. The other day I bought a Kenwood TM-D710A mobile that I set up for my car, and while programming it in my house, I set it for 50 watts (H) on UHF, and using the same house antenna, I noticed that I was able to make the trip to that repeater with no issue at all. It was refreshing for a change. Of course this is no surprise since it is 30 watts stronger.

My question is this... Is there an amplifier on the market that I can plug my Yaesu FT-897 into that will boost the wattage to at least 50 watts or higher? I was once told I don't need a tuner because I only work VHF and UHF, and at the moment, I only have a VHF/UHF antenna. Also, I'm really not looking to do anything illegal, I would just like for my 897D to have a little more power as the Kenwood D710A has. Any suggestions would be greatly appreciated.

Dan (et. al.),
I don't wan't to get into a flamefest over this, but the regs for 60m
do not address "tuning". They only address modes of operation.

Below is a snippet from the ARRL's 60-meter FAQ, which can be found
in its entirety here: http://www.arrl.org/60-meter-faq

"But if USB is the only permissible emission, how can hams "tune up"
on 5 MHz? That might mean putting out a carrier.
...
Most automatic tuners do require briefly transmitting a small amount
of carrier over the air. Not recommended but probably legal (as long
as you're not interfering with other stations) would be the tried and
true "whistling" or "hellllllooooo" methods."

I will also point out that antenna analyzers are no panacea. They
work by injecting a small RF signal into the antenna, too.

Reasonable people may disagree on the interpretation of the rules, and
if you believe a whistle is contrary to the rules, by all means don't
do it.

These are my final comments on this matter here,
Rob / KD8WK

Hi Dan,
A zero beat carrier would clearly be illegal by virtue of the fact that
it is outside of the assigned 2.8 khz passband for the channel, which
extends (presuming the amateur uses the FCC's suggested -1.5 khz carrier
offset from the channel's center frequency) from 100 hz to 2.9 khz above
the (supressed) carrier frequency. For a more complete explanation, see:

http://www.arrl.org/60m-channel-allocation
http://www.arrl.org/what-the-fcc-rules-say-97-303-s

Beyond that, if you'd still like to discuss it further, I suggest (and
would be happy) to do so off-net.

32042. RE: [FT897] S-Meter at maximum all the time

Yahoo group: FT897 (2010)
Date: 2010-12-07 06:19:03 UTC
From: Eric van de Weyer
Topic: 32031 Message: 32042

Hi Dale,

Make certain that Menu 080 (SQL/RF Gain) is set to Sql for squelch to operate on all modes. If it is set to RF Gain and you turn it down, you can get that sort of indication on the S meter as to reduce the RF gain it increases the voltage on the ADG line which causes the S meter to read high.

Of course, as you have been inside the rig with the soldering iron, you may have inadvertently screwed something up which is the root cause.

Subject: [FT897] S-Meter at maximum all the time

Hello Group
I recently fixed the dreaded "static crashes all bands all modes no antenna" problem on my 897. I replaced CF1005 AM filter, along with CF1002 & CF1003 FM filters and some of the switching diodes nearby. (Absolute torture, let me tell you!) The good news is this solved the continuous +S9 static crashes that is a common problem as has been discussed many times in the Group. The bad news is my S-meter is not right. When the rig powers up the S-meter starts at S8 and within seconds moves to S++ (max'd to right) on all bands all modes with or without antenna. The rig is working fine on Tx and Rx. I'm hoping someone with some circuit familiarity can help me troubleshoot the the S-meter circuit. I'm guessing it's driven by the AGC circuit, probably in the Q1099 area. This sort of makes sense since it's right after the filter circuits where I was performing microsurgery. Either the S-meter driver was also bad or I messed it up while fixing the filter problem. Another hint
- squelch works for FM but no longer works for other modes. I don't really know the details of how the AGC works and thus don't know what to look for on the oscilloscope. Any advice would be welcome.

From: Eric van de Weyer
Topic: 32032 Message: 32044

Hi Mark,

I had something that sounds similar happen to mine when it was quite new where the tone changed from a nice tone to a rather raucous noise each time. Everything else was working OK. I fixed it with a full reset of the radio.

Remember to save your memories beforehand so you can reload them if you try this.

Subject: [FT897] Strange tone

Hi all
My FT-897ND has started getting a strange tone on power up and when you use the menu key.
It is set for 440Hz but seems much lower and muffled untill the radio has been on for a while and then all is fine.
Any ideas what the problem could be as it drives me nuts?
regards
Mark

Thanks for the reply Eric.

I did not mention that I have changed my computers around and the one this radio has a CAT connection with now does not leave a supply on the USB port when switched off. While playing around to try and find the problem I discovered that if I switch the PC on first the radio was fine, but if I switch the radio on first I had the tone problem.

I have now connected the CAT lead through a self powered USB hub and all is well. I suspect it may be something to do with a cheap Chinese USB CAT lead.

Regards

Mark

Another cure for noise with a CAT cable is to switch from TXREQ to
TXGND. Remove the top cover of the radio. Right where the ground lug
is there is a jumper, J27 if memory serves (J1027 on the schematic).
Silkscreened is which was is TXREQ (default) and TXGND. Switching that
cured all noise from the cat and data cable when used with my laptop
while charging.

32047. monitor mode

Yahoo group: FT897 (2010)
Date: 2010-12-07 14:06:23 UTC
From: Bret McDanel
Topic: 32047 Message: 32047

I am wanting to use the data audio lines as a monitor mode for my radio. I want to record both what I say and what is received over the air on my laptop. Currently I can plug either the 1200 or 9600 lines from the DATA port in the back of the radio into the line in on my laptop and capture received traffic. I cannot appear to capture what I say when I use the mic. Short of getting a mixer to mux the audio output of the radio and the microphone is there a setting that will enable a monitor mode so that I can capture what I say?

I am using the DATA port so that I can use digital vox (menu #40) and have a remote streaming mic in addition to the local one. Dont try to understand, just accept that its done that way :) There is actually a reason for it.

If it is not possible short of splicing into the RJ45 jack with a mixer board to combine the handmic then that is what I will do, I am just hoping that I can avoid buying anything additional, but I have not seen any menu items that seem promising or anything in the manual.

Thanks

Hi Eric
Nope, checked that and it's ok. I'm in RF Gain mode and even with the gain pot all the way up (cw) the S-meter is still at or nearly at the right side. Interestingly the sensitivity of the rig appears ok and does vary with the RF gain pot setting as usual. I agree with you as to the probable root cause - a soldering iron on the loose over a PCB with the smallest SMDs I've ever seen (or more accurately, not seen, hi).

Hi Dale,

no problem. Sometimes when looking at such problems it is easy to overlook
the obvious and so it can help to get that reminder.

Yes, some of those parts are very small, aren't they? I actually have my
817 in bits at the moment chasing a problem with no output which is eminating
from the main board. there is no RF coming out of it to the finals board.
must get the bench cleared off and get back to repairing it as i miss the
little rig. I also have 2 100d's which need some work. will try to get back
to them all whilst I'm on holidays in a few weeks.

Anyhow, good luck with the problem. hope you manage to fix it.

73....Eric VK2VE.

Hi Bret,

No unfortunately there is no monitor function on the 857/897 which is really annoying when using a headset.
What I have done is to use a cheap stereo amplifier taken from some computer speakers. Feed the mic audio into one channel and the speaker output into the other channel.
Then combine the amplifier outputs to get a mono output into the headset. It's not perfect but it does work, although I did have a lot of RF feedback problems at first.

Ok, I will just get a cheap mixer board, which I can use for other
things so its not a great loss. I will then just wire up a connector
box and tap the mic off the RJ45. This will let me do a live stream of
the net (I am using stickam.com cause its free) as well as do remote
stuff from skype or whatever (digital vox instead of PTT).

I would start by doing a master reset of the radio, since I don't know if the AM power setting is via hardware or software.

Other than that, there may be a pot within the radio that sets the AM power limit.

32061. No FM om !0 metre band

Yahoo group: FT897 (2010)
Date: 2010-12-10 22:01:15 UTC
From: Stuart T
Topic: 32061 Message: 32061

I was trying out my new Windom with a friend G6JVT on various frequencies.
He suggested we try FM on 29MHz/10metre band. My radio comes up with 'TX ERROR' so I cannot transmit FM, all other modes appear OKon same frequency.
Any ideas please.
Thanks Stu G7HJN. Southern UK.

32062. The answer / Re: AT-897 won't tune

Yahoo group: FT897 (2010)

From: ke7adu
Topic: 31995 Message: 32062

I thought I would get back to the group with the rest of this story. This turned out to be one of those problems the has more than one issue.

Issue 1: My first AT-897 was defective (never even got the tune light to work).
I had some trouble convincing LDG about that but I sent an email off to cheapham.com explaining the issue and they arranged for FedEx to pick up the old unit and shipped me a replacement unit. I am very happy with the customer service.

At some point during the troubleshooting process the fuse blew on FT-897 CAT port so I ordred a five pack of pico fuses. The new tuner arrived Friday and the pico fuses today.

I replaced the fuse and hooked up the new tuner. With the new tuner pushing the tune button did turn on the the tune light but no tuning. I manually keyed the radio and pushed tune and the tuning cycle ran.

Issue 2: After triple checking my cables, I remembered that I had changed J27 several years ago so that the FT-897 would work correctly with my AL-811 tuner. I moved the jumper back to it's default position (two pins toward the front of the radio jumped) and retested. Pushing the tune button now started a tune cycle.

I have yet to attempt a QSO but I tested the tuner on several bands and it tuned to a near 1:1 match quickly. Looks like I will be a happy customer.

--- In FT897@yahoogroups.com, "ke7adu" <ae7hs@...> wrote:
>
> Today I received the refurbished AT-897 I ordered from cheapham.com. I carefully followed the instructions to install the unit to side of my FT-897D and then attached the cables per the diagram in the manual. Installed an antenna and pressed the tune button. Nothing happened. I checked Menu items 19 and 20 and set the unit to 4800 bps and CAT. The 897 was set at 9600.
>
> I pressed tune again for several seconds and still nothing happened. I power cycled the unit, double, tripe and quadruple checked the cables and I am convinced they are correct. My antenna is resonant on 160 meters so I tuned in a few QSO on 160 with no problem with the tuner in line. I also tried tuning on several bands I know require matching with my AT-1000.

From: Dave Nelson
Topic: 32063 Message: 32063

hi Stu,
'TX ERROR' always infers that you are trying to TX out of band
look to see if you have a split that is activated when in FM mode that
isnt when
in SSB. A 10M FM repeater split could be putting you out of band on the
freq
you are trying to TX on.
see if the display freq changes when you hit the PTT
Thats the first most obvious cause to check :)

Hello!

switch off the repeater-shift. On 10 m the shift is normaly 0,1 Mhz.
Maybe you are on -7,6 Mhz shift. That would lead to transmit outside
the 10 m band. Clever machine isnt it?

You know that you have to hold the TUNE button down until the red light extinguishes... Only then will the LDG tune. It's not a push and release - must be held until the light goes out...

That's right, and the quick push and release turns off, or bypasses the
tuner. I do this for 40 meters, for my 40 Vertical

Thanks for the input. That's was not the problem here though. With JP27 set towards the back of the radio a long push of the Tune button results in the tune light flashing for several seconds but the radio does not key. I will have to refresh my memory as to which setting is which but it seems that the LDG tuner will only key the FT-897 if the jumper is in the factory position. I think that is TX REQ as opposed to TX GRND. I don't use the FT-897 with my AL-811 any longer as I now use an FT-450 as my base rig so putting the jumper back is not a problem. I did think that this could benefit others who have changed the jumper or maybe bought a used rig that had had JP27 changed.

32068. Re: [FT897] The answer / Re: AT-897 won't tune

Yahoo group: FT897 (2010)
Date: 2010-12-12 22:11:06 UTC
From: Rob Stampfli
Topic: 31995 Message: 32068

This is very interesting. I have the AT-897Plus tuner, and it only has two connections to the radio -- one for the feedline and a second which connects to the CAT receptacle. I have also moved the J1027 jumper so that I could key an amp from the ACC receptacle, and I can confirm that doing so had no effect on the operation of my AT-897Plus.

The J1027 jumper allows one to configure the "ring" lead on the ACC receptacle to either place the FT-897 into transmit for tuning (the default) or to provide a keying signal for the amp.

After reading this thread, I found the manual for the AT-897 on the internet and compared it with mine. The AT-897 requires a third connection to the ACC receptacle on the radio and thus it would make sense that it uses the ring lead to key the amp. The AT-897Plus, OTOH, does not use the ACC connection at all. Instead, it places the rig in AM mode to provide a carrier. They even warn you that what you say near the mike while the rig is tuning can go out over the air.

I had thought that the AT-897Plus only differed in the number of memories it contained, but it appears that LDG also redesigned the way the tuner interacts with the rig to cause it to provide a carrier in order to tune.

And, BTW, both the AT-897 and AT-897Plus work similarly with respect to the button: A quick press will cycle the tuner between bypassing the tuner (3 quick flashes) and the last setting (1 flash). Holding the button until the LED comes on and then releasing it will cause the tuner to memory tune, if it can, and revert to a full tune if it must. Pressing the button until the LED turns on and then off again will force the LDG to do a full tune.

Stop transmitting on your radio until you get your antenna tuned or checked.

The radio is saying "Hi SWR" for a reason. If you continue to use it as such, you may be in for a big repair bill.

Disagreed! The FT-897 will cut back power when the SWR is in the "danger" zone. Yes the SWR needs to be adjusted, that is the correct thing to do, but it's a safety measure to protect the finals.

32071. FT-897 Display Question

Yahoo group: FT897 (2010)
Date: 2010-12-13 18:19:04 UTC
From: KA6UUP
Topic: 32071 Message: 32071

I recently had to do a reset on my FT-897 and now my display color is
not right.
I have the color I chose (menu 41 setting 32) for about 1/3 of the left
side of the display and the rest has a pinkish
tint to it.
I don't recall this being a issue before.
Can anyone suggest an explanation for this; and, hopefully, a fix?
tnx es 73,
Chuck KA6UUP

GA Chuck et al,
Have you adjusted the contrast setting? Not in front of my rig so check the manual for the menu location. Hope that helps!

I checked my contrast setting which is menu 42 and the setting is 4
which seems to be the best
for my preference.
This made no difference in the color variations in the display however.
Thanks for the suggestion Joe.

32074. RE:Problem with transmitting on some bands but RX fine on all bands

Yahoo group: FT897 (2010)
Date: 2010-12-13 22:07:50 UTC
From: wb6cyk
Topic: 32074 Message: 32074

The problem resolved itself, but can anyone tell me why the radio would selectively transmit on 6, 30 and 80 meters and have no output on other bands? The radio was tested connected to an antenna previously tuned with another radio. I paged through all of the menu items and compared the settings to the default values listed in the owners manual. I tried again with the tuned antenna and 160 through 10 worked fine. I had previously tried several coax connecting cables between the radio and the tuner being careful about a loose connector. When testing there was no indication of high SWR, just no output on the particular band.

Ron,

Thanks for the reminder on the jumper function. I was looking at the AT-897 Plus but found this refurb unit with factory warranty at cheapham.com for $120. It was too good a price to pass up. The unit works very well now that I have worked through the kinks.

It failed again this morning. On further testing it appears that that the bands that are working on transmit are 80, 30, 17, 12 and 6 meters. The other HF bands have no output on transmit. It appears to me that some component is failing in an early stage that determines the input frequency to the finals.

Maybe failing relays in some of your bandpass filters? How old is the rig? Has it been exposed to "salt air" as in near the ocean, or maybe extremely dusty conditions? Is the operator a heavy smoker?

Failed bandpass filters won't show on SWR because I believe the bridge is between the filter and antenna port. Also, without a schematic handy, I don't know if the receive side goes through the same filter.

Randy, the relay cleaning didn't help. No, the radio has been in a clean and dry environment here in Grants Pass, OR. No indication of SWR on the failed bands.

I have a copy of the service manual and schematics. Also a friend here who works on UHF equipment, has test equipment and will help me with this problem. Can you tell me where to look?

Thanks a bunch for answering my inquiry.

32080. AT897 and 6 meter

Yahoo group: FT897 (2010)
Date: 2010-12-17 21:01:42 UTC
From: Danny Loyd
Topic: 32080 Message: 32080

I just put up a 6 meter antenna and tried connecting to the rig through my AT-897 and got a high SWR reading on transmit. When I went directly to the rig without going through the AT-897, I got perfect 1:1 SWR reading and good power out reading. Does this mean that the AT-897 will not work with 6 meters? If so, will a antenna switch with the 6 meter beam going to one side and the tuner going to the other feeding to the rig on the input side work? Will the tuner tune through the switch?

Even though the specs say the AT-897 will work up through 6 meters, I never have had very good results with it up there. I do what you are thinking, and have a switch prior to the tuner. Actually, I have three switches: one to select between a Windom antenna, the 6 meter beam, and a tri-band beam, and two others to select whether to go through the tuner or not, since I only use the tuner on the Windom.

Hello Danny,

I note that you have good results on 6 M band working direct to the antennas, and want to use the tuner on another antenna, as you had done before starting on 6 Meters.

Easy way is to use a patch lead from the radio direct to the antenna switch input, one outlet port going direct to the 6 Meter antenna, and the other outlet port [using another patch lead] from the switch going to the AT-897 tuner as before, and then out to your original antenna set up.

That will allow, when you want to use 50 MHz you just switch over to the 50 MHz antenna, and forget about the tuner, as it is not in line when using 50 MHz on TX or RX.

Regarding the AT-897, it will work as before on your original antenna,,, just change the position of the switch to the position you have "marked" for that cable going to the tuner, and adjust [tune] settings as before.

Look up your local [50MHz] repeaters for stations using 50 MHz and tune around for stations to work , if you have not worked on 6 Meters before, you will find out where the SSB, and other modes gather when DX is working,,, otherwise you could miss a good opening.

If you have not already purchased an antenna switch, you can buy [the best you can afford] one with several outlets, to allow connecting several antenna systems in and out.

Hope to work you on six

You are talking about an LDG AT-897 tuner, right? According to the manual I pulled off the internet, the AT-897 has a bypass mode (like the AT-897Plus): From page 9 of the manual:

"To place your AT-897 in bypass mode, press the Tune button on the front of the AT-897 tuner and quickly release before the red LED comes on (less than a half-second). The tuner will switch to bypass; RF from your FT-897 transceiver will go directly to the antenna with no matching. There are no LED indicators for the bypass mode."

This is similar to the AT-897Plus, except that it flashes 3 times to indicate the tuner is in bypass. I use this mechanism all the time on my "Plus".

As far as 6m tuning, my "Plus" tuner works quite reasonably on that band, provided you adhere to the stated 50W power limit while tuning into a >3:1 SWR load.

YMMV,
Rob / KD8WK

With my AT-897 (non plus), even with the unit in "bypass" mode, I noticed a marked attenuation in signals on 6 meters. I had to physically wire around the unit for 6 meters to not be attenuated.

I realize this may be off-topic. However, I just wanted to thank all of you for your hard work on this great group. I am relatively new to the hobby and have found this group to be a great asset to me as I am exploring and teaching myself RF and radio operations. I am in school part time and work full time, and I just do not have enough time for experimenting. This site has saved me precious time and also given me some interesting things to think about as I play with my 897.

Holiday 73s to you all.

From: bustedflat42
Topic: 32088 Message: 32088

I have a spare Icom HM-103 hand mic and would like to use it on my 897. I know the pinout is different and have tried and failed to find an adapter, anyone know where I can get one? The MH-31 mic that came with the radio does not seem to get the job done on ssb I get lousy audio reports and have tried using the EQ and adjusting the carrier offset, mic gain, switch on back of mic and processor several ways and still not good. My voice is not real bassy nor high pitched Maybe I just need to buy a good hand mic to match me up with the radio but cant afford a pile of money and dont like desk mics nor a boom with a Heil on it. I know the Icom mic is electret and the Yaesu mic is dynamic. Any ideas would be appreciated very much.
73 to all and Merry Christmas
Bob (:

32089. Re: RE:Problem with transmitting on some bands but RX fine on all bands

Topic: 32074 Message: 32089

my ft897d also had a similar problem which would clear up when i sent the radio back to boot. it finally became a permanet problem and i have since sent it to HRO to get checked out. it would transmit SSB but only with a great amount of distortion, with the problem being greater on the lower bands. AM seemd to work OK. it could be a microphone connection or mike problem but i didn't have a spare to test. i got out my standby, the kenwood TS-520S. running fine after all these years, but a pain to adjust.

32091. Connecting FT-897D to both serial port for Ham Radio Deluxe and ARB 704?

Yahoo group: FT897 (2010)
Date: 2010-12-14 05:29:38 UTC
From: Richard
Topic: 32091 Message: 32091

The FT 897D has a single CAT/Linear port. To use Ham Radio Deluxe you connect the cable to your computer serial port. Now to use a linear amp such as Ameritron 811 you need to use the ARB 704 which also needs to access the CAT/Linear port. Without having to switch plugs all the time, has anyone figured another way to make this connection?

The ARB info doesn't recommend hot swapping the plug.

Any info is appreciated.

Rick kb4mis

32092. Re: Connection FT 897D, ARB 704 and AL 811H

Yahoo group: FT897 (2010)
Date: 2010-12-14 05:20:06 UTC
From: Richard
Topic: 31973 Message: 32092

Just got my ARB 704 to make up same configuration. According to instructions the jumper looks to be on JMP1 pins closest to R12 covered, and JMP2 pins closest to R15 are covered. The pamphlet doesn't mention the pin numbers. This is the default connection.

Do not put 12 volts to the ARB - the rig supplies power.
Only phono plug you need is ARB amp out to 811 relay port.

Hope this helps.

Rick kb4mis

Stop transmitting on your radio until you get your antenna tuned or checked.

The radio is saying "Hi SWR" for a reason. If you continue to use it as such, you may be in for a big repair bill.

On European FT897D this V/UHF plug is a N plug, far better than the HF one, with a continuity of impedance. You can either use a N plug or an adaptator N to 259 but never try to force a 259 into it.

If your FT-897D is recent, there is an undocumented internal jumper, J1027, located on the top board near the rear of the rig, roughly straight back from the tuning knob. It is used to select what the "ring" lead of the ACC receptacle is used for. By default, this lead is used by antenna tuners to cause the rig to go into transmit for tuning. It is used, for instance, by the LDG AT-897 tuner (but not the AT-897Plus). If you remove the top of your 897D and move the jumper to its alternate position, the amp keying indicator, brought out on the CAT cable, will be paralleled on the "ring" lead of the ACC receptacle. This modified pin-out really makes much more sense to me: If you then connect a 1/8"-stereo-plug-to-dual-RCA-jacks "Y" connector (commonly available for audio purposes) to the ACC receptable, the "tip" RCA connector becomes the ALC connection to the amp (if you choose to use it) and the "ring" RCA connector becomes the amp keying lead. You no longer need the CAT receptacle to control the linear. That's how I run my FT-897D and I'm very happy with it.

If you do this, just remember: if you ever use an AT-897 with the rig, or if you use the rig with certain Yaesu tunable mobile antennas, you'll have to reset the jumper in order the allow them to work.

There are CAT multiplexers available that will let you connect multiple
CAT devices to the radio. Additionally the mic jack can be used as a
cat port.

The microphone jack can be configured as a combo mic/cat jack. You will lose the up/down functions (I believe). I use an Ameritron on my FT897D with the rear port set to LINEAR and I use an RJ45 adapter to connect both my mike and USB CAT interface. The front jack is set to CAT. The Yaesu desk mike has a RJ45 jack on it that mirrors the radios. It can be used as the CAT connection.

Subject: [FT897] Connecting FT-897D to both serial port for Ham Radio Deluxe and ARB 704?

The FT 897D has a single CAT/Linear port. To use Ham Radio Deluxe you connect the cable to your computer serial port. Now to use a linear amp such as Ameritron 811 you need to use the ARB 704 which also needs to access the CAT/Linear port. Without having to switch plugs all the time, has anyone figured another way to make this connection?

The ARB info doesn't recommend hot swapping the plug.

Any info is appreciated.

Burton,

Unfortunately, I have no technical expertise with this radio. My filter relay "guess" was truly just a guess. After consulting the schematic, I see that it was likely wrong in the first place. Some of the bands that are working use the same filters as those that aren't.

If it were me, I would begin troubleshooting by looking for RF output at the lowest level stages on the bad bands (output of the SSB filters, etc.) and go toward the antenna from there. Since the problem only effects certain bands, it's likely that the problem is with your digital control circuits and not RF related. If you were having problems with losing output on certain frequencies within the same band, I would look at the VFO output. However, I doubt this is the case.

Sorry I couldn't be more help.

Rick ,
I'm not sure myself , all 3 have me confused , the Yaesu manual , the 704 manual and you post seems off .
The way I have it figured is the both jumpers are towards the center with the open connectors on the outsides .
You mention the only phono plug you need is ABR to amp .
The way I read it is the only way the amp gets the transmitted signal , is with the phone plug from the radio to the ABR radio connection , then out of the ABR amp connection to amp .
Also you mention not to use 12 volts to power the ABR , the manual mentions this if you using the plug & play cables , you state seems to assume this .
Just looking for clarification for myself & others reading .
I am not sure about the jumpers , but I'm pretty sure about the amp cables .
I do not have the plug & play cables yet , the web site does not show the 897D on the list .
Even if I had everything hooked up correctly , it would work because my radio is not working correctly , it is only putting out about 2 watts , may have blown the finials or it came to me that way , have made lots of contacts , but its all QRP , not enough to drive the amps .

I didn't change the jumpers as they came factory set for most newer HF rigs.

Connected the plug n play cable to the arb and radio and phono plug labeled amp on arb to relay phono jack on 811 and that was it.

I followed all the tune up procedures. I know what settings my tuner needs to be set to for lowest swr. Tweaked both tuner and plate n load and got full power.

Hope this helps.

So the specifics on this was I had it running off a bad deep cycle battery that would not take a charge - and I had the raw DC unfiltered charger connected to the battery. The regulator was a simple 7808 3 terminal regulator, but to find it, I had to jumper the main power relay on. Spent about 8 hours overall, but it has ran for 2 days straight and works on every band into a dummy load.

I won't run it on a battery with a charger attached again.

Regards,

Ryan

Well, I would dispute the implication that the SO239 "is not broke". I believe that a friend's description of a PL259 as a "shrouded banana plug" is most appropriate.

There is no real technical reason to replace the existing connector with an "N type", you are only moving the discontinuity a few mm further into the radio. However, there is a good logical reason and that is to prevent accidental cross connections (HF/VHF).

Incidentally, do I have the only European FT897D with two SO239's.

FT-897 frequency scale reversed ?

Don't see it , must be a box to tick ?

CAT all works fine , but when the frequency display over the waterfall is showing the -rf carrier- frequency , then the scale is
reversed , with frequency decreasing as position moves to the > right > 9-8-7-6-5-4- etc

If Rig is running is USB .. scale read ok . 1-2-3-4-5- etc

Change to DIG user U or psk U , then set is still on the same frequency , but the frequency display in reversed . ?

(checked with DM780 and the frequency matches the set , as audio f increases rf increases)

Any ideas ?

If you look in the MFJ 2011 Catalog it also list the PNP-8M cable as working with the FT-897D.

32129. Re: Which Antenna plug

Yahoo group: FT897 (2010)
Date: 2010-12-20 16:24:05 UTC
From: Steve Yates
Topic: 32095 Message: 32129

Although the N connector tries to maintain a 50 Ohm impedance while the SO-239 does not, the biggest impedance bump is the connection from the circuit board to the connector. No attempt at maintaining 50 Ohms is made here. Therefore, at 70 cm and longer I see no technical justification for swapping to an N connector at this point since its improved impedance characteristics will be nullified by the internal connection to it.

Now if all of your VHF/UHF cables are already fitted with N connectors then that's another story.

60 meter? It is not one of the 5 US frequencies for 60m, but it is that
band.

From: Charles
Topic: 32132 Message: 32132

As a result of my having to do a reset (Home + power up)
I am going to have to re-set up my memory channels.
When I press the V/M key, Ma01 is shown on the display, but
I cannot dial through the memory locations using the Mem/VFO Ch knob.
When I press the Mem/VFO CH knob I get the flashing Ma but cannot dial through the locations.
This is also true if I activate the Memory Groups.
What am I missing here?
Tnx es 73,
Chuck KA6UUP

> What is this?

Yaesu played sort of loosey-goosey with the design of the way "non-ham" bands are displayed on the 897. It's like they allocated a couple extra floating bands for the UP/DWN band switch sequence so that if you tune outside the ham bands -- say to listen to a broadcast station -- and then jump to another band, the previous frequency will be retained in the sequence as you scan through the bands again later. However, only a few extra floating bands are allocated, so when the rig preserves some frequency in this manner, it does so by purging a previously recorded frequency on some other band. To me, it involves some rather confusing human factors, although some engineers at Yaesu must have liked it.

In any event, even the 897D had no 60-meter ham "band". Instead, it had the 5 legal channelized frequencies encoded from the factory in certain memory locations. If you've just reset your rig, hit the V/M switch and give the MEM/VFO knob a spin. If you have the D model, you should see a few pre-initialized channels, like 5.332.00 and 5.348.00, pre-stored in memory channels M-601 thru M-605. That's the way the 60 meter band may be accessed from the 897D.

Hope this helps,
Rob / KD8WK

Chuck-
When you rotate the "MEM/VFO CH" knob, it goes from one channel (that has info stored in it) to the next one and so on- If nothing is stored, it has no-where to go- I have a few questions-
1- Just out of curiosity, why did you have to do a full re-set? I've had my FT-897 for 7 years and have never had to do a re-set of any kind. Maybe I'm lucky?
2- Are you going to be programming into memory channels repeater info and simplex frequencies?
3- Do you use a computer to program or do you do it manually?
4- If manually, would you like me to send you my list of "programming steps" that is kind of foolproof?
5- Do you have or have you considered buying the external "LDG Meter"? It's really helpful- go to: http://www.w4rt.com

From: g8ubj
Topic: 32135 Message: 32136

I have one, but only use it on 6M to monitor power.
Its reasonably accurate and good value for money.
The meter has SO239 sockets which can't be replaced so if you prefer N-types you can't upgrade. The PEP meter doesn't read true PEP more like a moving average.

If you wan't a better meter have a look at the Daiwa CN 801S SWR/Power Meter. For true PEP reading the PALSTAR PM2000A Watt Meter is a better buy but only covers up to 60 Mhz

If you have the cash buy both and leve on on the HF output and the other on your VHF UHF?

I know mine are :-) Thankfully both my 857 and 897 use N connectors for UHF. Though my kenwood D710 for some reason uses a SO239! First radio UHF/VHF radio I've seen here in .au with one! Bloomin annoying, since I didn't look before I mounted it up and cabled it in the car, so there's now an N->PL259 adapter in the line.. Gotta get around to phoning the dealer and seeing what it'd cost to get the SO239 swapped to an N socket sometime (to keep the warranty valid :-p)... (handily enough, though I live ~100km from the dealer, their *service* bloke lives a suburb away :)

To confirm what Rob stated in a previous reply, try transmitting on that 5.250 frequency. If it is indeed a "receive only" band, you won't be allowed to transmit.

Is this true when Memory Groups are activated?

I have a few questions-
> 1- Just out of curiosity, why did you have to do a full re-set? I've had my FT-897 for 7 years and have never had to do a re-set of any kind. Maybe I'm lucky?

The A,B & C Buttons locked up (and other anomalies) and nothing I could do would return them to operation.
After rereading the manual I did a reset.

> 2- Are you going to be programming into memory channels repeater info and simplex frequencies?

Yes

> 3- Do you use a computer to program or do you do it manually?

No. However, I plan to get software to take care of this.
Do you have recommendations?

> 4- If manually, would you like me to send you my list of "programming steps" that is kind of foolproof?

Yes. And thank you.

> 5- Do you have or have you considered buying the external "LDG Meter"? It's really helpful

That too is on my to-do list.

What rig.xml file are you using for FLDIGI? I found the stock FT-857 file includes the PKT mode in the section for 'reverse' frequency such as LSB. I removed PKT and saved the file as FT897.xml file for FT897, and everything's been happy.

If you're not using rigcat you should look for a similar config file issue for the CAT mode you're using.

From: BARRIE
Topic: 32141 Message: 32141

Please could anyone go thru the steps for getting HRD AND FT897 to work together please?.I have followed the stahndard procedure but I keep getting cannot connect to radio message,/Thanks and 73 Barrie g4yjs.

32143. 897D PSK31 Narrow Filter Center Frequency

Yahoo group: FT897 (2010)
Date: 2010-12-20 19:44:42 UTC
From: joncrockrell
Topic: 32143 Message: 32143

I now own the 857D and am wanting to purchase the 897D. I often operate PSK31 with the 857D in USB mode instead of the Digital/PSK31 setting because I like the way it centers the narrow 300Hz filter in the middle of the waterfall at 1500Hz.

I use the rear data port and a Signalink USB.

My question: Does the 897D also center the narrow 300Hz filter at 1500 while in USB mode like the 857D? Also, does it allow you to use the data port while in USB mode like the 857D?

Thanks, this is my first post and hopefully not a double post; I forgot to sign my first one with my callsign and I never saw it here.

Thanks Again!

Jon

If anyone has the answer to that one, please pass it on to me. I am running DM780 but cannot get HRD to synch with my 897D. Keeps on returning "0" for the frequency. Since DM780 clearly knows what frequency I am on, no idea why it doesn't share that with HRD.

Randy, we are going to look at the path of the RF today or tomorrow. There is a relationship between the bands that are not working, they are multiples of five. Is there a processor that generates the basic carrier frequency on these bands? I also plan to email Yaesu today.

Here is another thought, I do not know what tests you done already, but for what it's worth there have been PA board interconnect issues with some 897's it might be worth your time to pull and reconnect the PA board as a just in case test. The 24 pin connector J3002 caries the data stream for IC'S Q3005, Q3013. 4094 shift registers.

> > If it were me, I would begin troubleshooting by looking for RF output at the lowest level stages on the bad bands (output of the SSB filters, etc.) and go toward the antenna from there. Since the problem only effects certain bands, it's likely that the problem is with your digital control circuits and not RF related. If you were having problems with losing output on certain frequencies within the same band, I would look at the VFO output. However, I doubt this is the case.

32149. RE: [FT897] Re: FT897 AND HRD

Yahoo group: FT897 (2010)
Date: 2010-12-22 20:06:09 UTC
From: Robert Tuck
Topic: 32141 Message: 32149

What have you done so far?

What interfaces and cables are you using?

Is HRD set for the 897?

Are you using the correct port on the 897?

Are your settings on the 897 correct? (CAT Control)

What version of Windows are you using?

USB or serial?

I am using HRD/DM780 with my FT897D without any problems. I am using the USB Yaesu CAT/program interface through the microphone port (the rear port is set up for my linear amp.). I use a SignaLink USB for the sound. These USB devices plug into a POWERED USB hub (to reduce the drain on my laptop running Vista) and then the hub is connected to my computer. The hardware was plug and play. I set the front mic port to CAT. That way it operates as a CAT port and a mic port. I do lose the mic up/down functions. The Signalink is plugged into the aux port. The rear CAT port is set to LINEAR for my amplifier. In HRD/DM780, I selected the FT897 and everything worked.

I usually start HRD first and then launch FT780. I believe that there is an option in HRD to sync with DM780. I could email you my config files for HRD and/or DM780

Subject: [FT897] Re: FT897 AND HRD

If anyone has the answer to that one, please pass it on to me. I am running DM780 but cannot get HRD to synch with my 897D. Keeps on returning "0" for the frequency. Since DM780 clearly knows what frequency I am on, no idea why it doesn't share that with HRD.

Hi Gordon,

Do you have the data rates set the same on the radio and in HRD and have
you set the correct serial port as determined from Device Manager. You can
also find with USB devices that they will come up as a different serial port
when you move them between different USB sockets.

73....Eric VK2VE.

I to am curious about setting up HRD. I've not use any computer control before but I was considering it. My PC has a delta1010LT(24bit 96khz ASIO) sound card in it so if I am correct in my understanding I only need a CT-62 cable to complete the setup? My understanding was that if you have a good sound car you don't need something like a rigblaster, but jus the CAT CT-62 cable, is that correct?

I do have an LDG AT-897plus so I know if I want to use the tuner I am limited to using the cat at 4800.

Good Evening Group,

Just a quick question to see how many of you use the FT-897 for sideband or satellite work. Have you been pleased with the 897 on am/fm work, or would you go another route if you wanted to chase V/U contests or satellites?

Thanks & Seasons Greeting to All!

Yes, and the 897 runs just fine using HRD @ 4800 baud

Hi Chuck,

With three First Place wins in recent VHF QSO Parties, I would have to say that the 897D is a fine player on SSB.

As for satellite work, there are better "cross-band" units available. However, I wouldn't count this radio out. It just depends on how serious a satellite chaser you are.

Hi Jon,

I just tested this with my 897D and I would have to say the answer to your question(s) is a big, fat, YEP! In fact, the 897D and 950 both use the same type of connector, so it's a simply job to change radios by simply unplugging one and plugging the other in.

Patrick & Randy, Many thanks for your replies. I don't know how serious a satellite chaser I'm going to be Randy. Just very interested in giving it a shot.

I just received a nice 2 meter yagi for Christmas and am trying to decide whether to find an older VHF/UHF all mode radio, or whether it would be better to go with something like the Yaesu FT-847 or Kenwood TS-2000 (as compared to the 897D) as a shack in the box with emphasis on VHF/UHF/Satellite over HF in contesting ability.

Thanks & Seasons Greetings!

As a follow-up comment regarding your success with VHF contesting Randy, let me also state that we have one "regular" on our Monday night 2 meter net (K4MSU repeater) who operates an 897D.

His audio is always good, and signal strong. I've been impressed with the sound of the rig. Just primarily wondering if it would be up to the task of a "starter" rig for satellite ops if I become really interested in that mode of operation.

Thanks again for your reply & 73 to all!

Data rates are 4800 in both my radio and in HRD. Available ports are four and five and i have tried using both ports. Still get a reading of zero for the freek and a warning that I may be in memory mode. But DM780 has no trouble reading my frequency (14070) and since I am making QSOs, I obviously am not in memory mode.

I am sure it is something pretty simple that I am not getting, but no idea what that might be.

Link is SignaLink USB--obviously xconfigured oorrectly since I have worked Digipan in the past and am working FLdigi ansd DM780 right now.

From: Burton
Topic: 32074 Message: 32160

I don't have a logic probe. I performed another test with a working radio. I ran an insulated output wire from the FT-897 directly to the input connector on the working radio tuned to the same 20M frequency so it acted like an antenna. There was no indication of RF being received in the working receiver. If the first stages are working in the FT-897, shouldn't you be able to hear a weak signal?

> > >
> > > If it were me, I would begin troubleshooting by looking for RF output at the lowest level stages on the bad bands (output of the SSB filters, etc.) and go toward the antenna from there. Since the problem only effects certain bands, it's likely that the problem is with your digital control circuits and not RF related. If you were having problems with losing output on certain frequencies within the same band, I would look at the VFO output. However, I doubt this is the case.

not a good thing to do !!!! it would have meant instant death to the
receiver in
the "working" radio if the faulty had suddenly decided to transmit !
Dont do it again :)

DONT connect the radios directly the faulty radio transmitting into a
dummy
load and the receiving radio having either no antenna or an antenna would have
been a good enough test

cheers
Dave

Pancho:

Press V/M button to enter memory system.
Press F key and select "MFb" menu.
Press "A" (MW) button (now "SKIP" item is changed to "MCLR")
Press "B" (MCLR) button to clear your selected memory.

From: tomglaab
Topic: 32152 Message: 32165

> Just a quick question to see how many of you use the FT-897 for sideband or satellite work.

A friend who's into satellite work prefers to use two separate radios. On FM the 897 doesn't switch between TX/RX quickly enough for him, and in SSB he prefers a full duplex setup. Normally he uses a FT-817ND for the downlink, though I suspect you could use a FM/SSB HT instead.

32166. Poor receive

Yahoo group: FT897 (2010)
Date: 2010-12-22 08:47:30 UTC
From: gd6icr
Topic: 32166 Message: 32166

After transmitting on 2/70 when returning to receive it seem either a relay is not connecting or radio is in invalid receive mode
. Changing band or mode then corrects the error. Anyone seen this yet - Radio is 2 years old - no problems previously except showing high swr - when not high on 28/6/2/70.

Any help please

Mike

Bryan,

The CT-62 or its generic equivalents connect the radio to remote control software like Ham Radio Deluxe. This does not provide an audio path for digital modes. In fact, remote control is not required for digital modes at all if you're willing to adjust the radio's frequency, mode, etc. manually.

In order to work the digital sound card modes, you will need some interface between the radio and the computer's sound card. The interface provides a transmit audio path from the sound card speaker output to the radio's mic or data input, a receive audio path from the radio's speaker or data out to the sound card's mic or aux in, and some method for activating PTT. Some commercial interfaces have their own built-in sound cards while others provide isolation between your sound card and radio to prevent ground loops and a PTT function.

Sound card interfaces can be home brewed or commercial, but you will require some type of interface besides the CT-62.

Chuck:

Can't comment on the satellite aspects.

What I can tell you is that the 897 is a fine VHF/UHF radio. I know a few rovers who use it and it gives them three bands in one box. Two of those guys have done the mod where you put a DEM 222 XVerter in the battery bay and have FOUR bands in one box. (.pdf of instruction article for mod available from me (W0ZQ author))

I don't really have experience with the 847 or ts2000 but they are bigger "boxes" and cost more (I think).

So I'm real happy with the 897 and this support community and I use my 897 primarily for VHF/UHF.

Menu 20 must be set for CAT.

Check the baud rate setting in menu 19.

Verify the serial port used to connect the CAT level converter. If you're using a USB - serial adapter and unsure of the COM port, watch Device Manager as you're plugging in the adapter to see what port appears.

Ensure that the converter is inserted all the way into the CAT/Linear port on the radio. Sometimes the recessed port on the radio prevents some connectors from making contact. Some people have had to trim some plastic from the connector to insert it completely.

On the Connect screen in HRD, make sure the COM port and baud rate match the information you came up with in the above steps.

Good luck!

I own a FT-817 for some years and general pleased with them.
Now i trade a old TS-450 for a used FT-897D, so far nice working radio, i am a novice with the 897D so all comments will be apreciated.
I read some stuff about modifications over some issues of the 897, like fast AGC, Processor improvement, voltage control of exciter transistors. Dont know if the FT-897D have some corrections to that situations!
Wish you all a Merry Christmas.

audio and ptt are not done through CAT. I think you mean the data port,
which does have audio and a ptt trigger. PTT can be triggered via cat,
but if CAT works that will work since CAT is just a serial interface to
the radio.

Please clarify what you mean, do you mean the data jack or the cat jack
(they are next to each other).

32174. SisnalLink USB w/ Ham Radio Deluxe

Yahoo group: FT897 (2010)
Date: 2010-12-29 11:47:34 UTC
From: B Young
Topic: 32174 Message: 32174

I just purchased a SignalLink USB and selected the Data Port cable (din plug) with the unit.

I am using Ham Radio Deluxe (connected via the CAT cable) and I want to configure it for Voice, but I understand when you engage PTT via the CAT cable it looks for audio via the RJ45 mic input and not the Data Port. I understand that I will need a program like IPSound of Skype to move the audio accross from the remote to the server machine (HRD installed).

Is anyone using a SignalLink USB with the Data Port connector? If so how are you triggering the PTT? I have been reading that the Data Port is great for digital but is not a good choice for voice.

My goal is to be able to use the FT-897D remotely (voice not digital) on my Local LAN and via the internet. I may have to order from TigerTronics website the RJ45 Mic cable.

Any advice would be appreciated.

From: Robert Tuck
Topic: 32174 Message: 32175

I use HRD, SignalLink USB, the Yaesu CAT interface & cable and I have a linear attached.

The linear is attached to the rear port (and the program step is set to linear).

The SignalLink USB is plugged into the rear data port on the computer.

I am using a desk mike and it has an extra RJ45 jack on it, which I use to connect the CAT control cable.

(The microphone program selection is set to CAT, I lose the up/down functions of the mike)

I set up HRD/DM780 to use the FT897D.

From there, I just had to setup any preferences that I wanted in the programs.

WHEN the data mode is selected on the FT897D, the audio in/out goes to the rear connector, when any other mode is selected, the microphone is active.

It works like a charm!

No other programs were needed.

The PTT is controlled by the SignalLink. The SignalLink can be used by itself without the CAT control.

I have not tried to use it across my LAN. But, I believe that it would only require me to remote access the machine attached to the radio. (for digital modes)

I have not tried using the data port for voice.

Robert

Ok, I had planed to just use the data port with a cable setup like this (http://www.xggcomms.com/page4.htm) that CAT + Audio interface.
What is the difference between using something like that and and something like a signalink+ or rigblaster pro? I'm just wondering if I need to spend the money of an interface device of if I just need the cables and what exact benefits the interfaces offer over just cables. Also if it's better to go with an interface is there a comparison chart somewhere to help me decide which will be best for me based on how I want to use it?

Thanks

Thanks Robert.

I understand that digital works great. I am interested in voice. And the tricky part appears to be triggering PTT. I believe I am going to have to order or build a RJ45 cable from the SignalLink RJ45 jack to the RJ45 microphone jack .

I am just not sure if it would straight through cable or based on a wiring diagram. I have the jumper module for the FT 897D installed in the SignalLink box.

Subject: Re: RE: [FT897] SisnalLink USB w/ Ham Radio Deluxe

Thanks Robert.

I understand that digital works great. I am interested in voice. And the tricky part appears to be triggering PTT. I believe I am going to have to order or build a RJ45 cable from the SignalLink RJ45 jack to the RJ45 microphone jack .

I am just not sure if it would straight through cable or based on a wiring diagram. I have the jumper module for the FT 897D installed in the SignalLink box.

From: Steve Yates
Topic: 32166 Message: 32180

Mike,

You had my curiosity up so I examined the circuit a bit. Of course, like any computer problem the first thing you do before tearing into the hardware is reboot. Or in this case, a Master Reset.

For 2 m and 70 cm no relays are switched when going from transmit to receive as they are on HF and 6 m. However, there are several diodes that are used to control the signal paths. Since your receive ability always comes back I suspect that the diodes are good but maybe the circuit that controls them is a little flakey. The common denominator for all of your problems maybe be the IC D3050 (P/N DAN235U) on the PA Board. This circuit controls which front-end (VHF or UHF) is connected to the main receive path. It may not be selecting either. This chip also controls the fan operation so I wonder if you've had any weirdness with that? Of course the processor controls everything.

In reality, the problems you are having could be caused by a multitude of different things and only a good troubleshooting process will find the culprit for certain.

Just some of my thoughts, I hope you find it.

73,
Steve - AA5TB

Hi I am having problems using digi mode on 40m only
I have LDG AT-897 Plus to a G5RV half size.
I press the tune button and hold until the LED goes out and it tunes ok one blink of the LED
I am only using 10w of power, start to transmit through hrd program after a few seconds the SWR ramps up and get the high SWR on the 897 display.
Please help

Graham,

Question, why are you using "digi" mode?
I work digital at least 85% of the time on the 897 and always use USB without problems.
I have had a G5RV half size hooked up to the radio too and have never had a problem, also use the LDG tuner.
I did stop using HRD after I got comfortable with the 897 though, didn't have any use for it anymore.
Do use the Signalink USB sound card interface and make sure the ALC reading on the radio is not showing,
high ALC does increase SWR on my radio, but never to a high enough level for the radio to blink "high swr".

Hope everyone had a good Christmas and Happy New Year to all.

Cheers and 73 de Jose Douglas - KB1TCD

grin you answered your own question.. :)

The Signalink does PTT to the data port - which tells the radio that it should take input from the data port, no matter what 'mode' it's in..

If you're using HRD to do PTT via the CAT port, then the audio input comes from wherever the mode setting tells it.. - 'digi' or 'pkt' modes, it comes from the data port, other modes it comes from the mic..

That drove me absolutely insane when I first went to hook my PC up to the 897 - I'd previously only used it direct to my 1270, which of course goes in via the data port, with PTT triggered from there also. Then went to CAT control with HRD doing the PTT via cat commands, rather than the data jack, and nothing I did would get audio out on TX.. Till I went and fiddled with these 'digi' and 'pkt' modes.

Annoying thing is that the difference between the PTT options isn't mentioned specifically anywhere, not even when I googled for it.. Seems most folks just take the manual for granted and use the digi/pkt modes for digital data, rather than (as I've always done) selected the mode they wished to transmit on normally..

Cheers,

Damien

Robert.

If you have that RJ45 Mic cable, then you need to plug the included cable (1/8 male to 1/8 male) into SPKR jack from the Headphone (with an adapter from 1/4 to 1/8) or External speaker jack. Then you can use HRD TX button to trigger PTT through the Mic Jack.

I have the SignalLink USB with the Jumper Module for the FT-897/D. I am just wondering if that RJ45 mic cable is just a straight through cable (4 pair) or is it using 2 pairs of the 4, etc? I have built standard Cat 5 network cables. If you have a Cat 5 (RJ45) cable tester, you could plug the RJ45 mic cable in and see the what wires are used and if they crossover, etc.

I believe there is no wiring diagram for that cable on the TigerTronics website. I don't know whether you can see the number of pairs used looking at the RJ45 connectors. Or if one side of the cable is for the SignalLink RJ45 jack and the other the Mic jack on the radio.

Thanks again for your help. Any insight would be appreciated.

Graham,

Having read some of the answers I hope you are less baffled than I am!

You say 40m only so I presume you are able to use digital modes on other bands successfully. Can you use CW or phone OK on 40?

I have a similar rig combination to you. An old LDG AT897 not an auto.

I had a similar problem on 15m (and only 15, 80/40/30/20/17 and 12 all OK), using a home built doublet (35' each leg). I fitted a choke in the feed to the aerial and 15 was fine as well afterwards.

I was advised to change the length of the co-ax to the aerial but I had already scrapped the doublet by then so I never got to the bottom of it. Using the same coax to an 80m inverted L does not give the problem on 15 even with no choke in the feed line.

The problem is the G5RV. They are best 20-17-15-12-10. anything lower than 20 is a minimal antenna! trust me I know. I have played with these things. Been licensed since 1993. I don't know if you hv the space, but a 80 or 160 meter doublet feed with 450 ohm feed line is an incredible multiband antenna with a tuner.

32188. RT Systems cable as CAT cable

Yahoo group: FT897 (2010)
Date: 2010-12-30 02:22:35 UTC
From: Brad
Topic: 32188 Message: 32188

I have an FT-897D and purchased the RT Systems software and cable for programming. It works as expected.

It also mentions that I can use the same cable as a CAT cable to my computer for use with HRD. Unfortunately, that application seems to be spotty. If I plug the CAT cable in after I power up the radio, everything works correctly.

If I plug the CAT cable in before I turn on the radio, all of the beeps and tones from pressing buttons etc are distorted. RX and TX seem to be unaffected.

If I add my LDG 897Plus tuner into the mix I get similar results except the tuner also errors out with a never-ending flashing LED. If I plug in the tuner without the CAT cable, everything works correctly every time.

Am I doing something wrong? Do I need to find a better CAT cable for use with HRD? If I need to buy a different cable, please recommend one (USB please). I don't mind buying a separate one for HRD versus programming, but I don't want to go through multiple trials and errors to find one that works the way I want.

Thank you

/KF5DWC [Brad]

Thanks for the follow-up, Graham. Glad you got your problem ironed out. Many times, the solution is so simple that we tend to overlook the obvious.

I had a similar situation with my triband beam on 15 meters. The tuner would get the SWR down for one transmission. On the next transmission, the SWR would be up again. The problem was with the 30+ year old antenna which I have since replaced with a new M2 tribander.

32192. RE: RE: [FT897] SisnalLink USB w/ Ham Radio Deluxe

Yahoo group: FT897 (2010)
Date: 2010-12-30 21:46:59 UTC
From: Robert Tuck
Topic: 32174 Message: 32192

It appears to be a standard straight through cable.

For anybody interested, using the RJ45 Cable:
The internal SignaLink USB jumpers are different that they are for the data port cable.
G goes to 7, PTT goes to 6, MIC goes to 5. The receive audio does not connect to the microphone RJ45 connector.
The receive audio needs to be connected to the speaker jack to the SPKR jack on the SignaLink USB

Since I am using a linear on the rear CAT/Linear port, I am using the microphone connection as a CAT port and a mic port. The SignaLink is using the rear data port. I don't see why I could not use the SignaLink on the microphone connection also.

If you are making a cable, I would use shielded CAT5e/6 cable, as short as possible. This would eliminate a possible source of hum pickup.

Subject: Re: RE: [FT897] SisnalLink USB w/ Ham Radio Deluxe

Robert.

If you have that RJ45 Mic cable, then you need to plug the included cable (1/8 male to 1/8 male) into SPKR jack from the Headphone (with an adapter from 1/4 to 1/8) or External speaker jack. Then you can use HRD TX button to trigger PTT through the Mic Jack.

I have the SignalLink USB with the Jumper Module for the FT-897/D. I am just wondering if that RJ45 mic cable is just a straight through cable (4 pair) or is it using 2 pairs of the 4, etc? I have built standard Cat 5 network cables. If you have a Cat 5 (RJ45) cable tester, you could plug the RJ45 mic cable in and see the what wires are used and if they crossover, etc.

I believe there is no wiring diagram for that cable on the TigerTronics website. I don't know whether you can see the number of pairs used looking at the RJ45 connectors. Or if one side of the cable is for the SignalLink RJ45 jack and the other the Mic jack on the radio.

Thanks again for your help. Any insight would be appreciated.

Hi Robert,

When you mention straight through, is it all 4 pairs (8 wires) of the Cat 5? Sometimes when they build cables they only include the actual wires that are being used. It appears you have been able to verify that all 8 are present and straight through.

I purchased the Jumper Module and it is apparently only for the data port cable. So I will have to remove the jumper module and manually wire based on your instructions below.

I have already mentioned to TigerTronics that they need to qualify what if voice, digital, or both are going to be used. I would have probably forgone the data port cable and got the mic cable and probably not purchased the jumper module. They have a new jumper module they are releasing soon for RJ45 mic input. It is not available yet.

Thanks again!

Happy New Year!

All 8 wires are present, but not used. Straight through. I use wire jumpers in a component socket (plug in) to create my own module.

32197. Band Noise and Cat interface

Yahoo group: FT897 (2010)
Date: 2010-12-31 08:40:57 UTC
From: gd6icr
Topic: 32197 Message: 32197

I have noticed on connecting HRD and not before, that the band noise on 40/20 jumps up by about 15dB - cable is permanently connected tho and removing or replacing it normally doesnt generate band noise anywhere (took me an hour to check) So why when data cable is active should it generate noise. Have had a basic spectrum analyser test this and cant see any sproggies (in or out of band)on it or the oscilloscope - tried inline toroids etc but cant seem to cure - definitely blocks me for PSK31 or reduces chance of contacts. Audio lines are isolated by transformer so no earth loops there either. and switching lines are relay only.

Help Please

Mike

32198. Help with WinWarbler and PSK31 with FT-897D

Yahoo group: FT897 (2010)
Date: 2010-12-31 14:15:15 UTC
From: pascalpete
Topic: 32198 Message: 32198

Greetings All,

I was hoping someone who uses winwarbler for PSK31 could tell me something...

I just got a SignaLink USB and began trying my hand at PSK31. Using WinWarbler, I am able to copy PSK31 QSO's rather nicely. What I cannot do is get anyone to hear me!

Here is my question: When I transmit using WinWarbler, should the frequency display on my radio change? I mean, it is set at the "base" of the spectrum display, but when I select a pane and begin transmitting, I see the radio click to transmit mode, but the frequency display remains on the base frequency for the display (I guess I was expecting it to quickly jump to the frequency where my particular input pane is set). I don't know if this is some sort of "split frequency" operation on the radio (I am still learning about the radio) or is just plain wrong!

My thought is that maybe no one his hearing me because the radio is transmitting on the wrong frequency!

Perhaps if someone who uses WinWarbler could tell me what THEIR freq display does when they transmit with WinWarbler with PSK31, it would help me get past this roadblock.

Thanks!

Hi Mike,

You're not alone! HRD polls the radio every few hundred milliseconds, which is a lot of serial activity. Toroids on the USB and/or CAT cable can help, but may not kill it all. I've gotten rid of it on most bands, but Murphy's law says it will always be present wherever you're trying to work. :-)

You can configure HRD to poll less frequently and also to poll only when it's the active application. Look at the "Polling" tab under configuration. That way when you're making a PSK contact via DM-780 HRD won't be polling and generating noise. The only caveat here is that if you manually change frequencies i.e. via the radio, not HRD, you'll need to switch back to HRD briefly so it can update to put the right frequency in the log.

Hope this helps.

the easiest way I have found is to properly ground the radio, then open
the top cover. At the back of the radio almost dead center is a jumper,
marked J27 on the board (J1027 on the schematics). Set it to TXGND
instead of the default TXREQ, the silkscreening tells you which position
is which. Close it back up. Most if not all the noise should just
vanish when using cables, at least it did for me.

Ah...found my own answer. The problem had nothing to do with the freq showing on the dial...and to answer my own question...no, the freq on the dial does not seem to need to change.

> Here is my question: When I transmit using WinWarbler, should the frequency display on my radio change? I mean, it is set at the "base" of the spectrum display, but when I select a pane and begin transmitting, I see the radio click to transmit mode, but the frequency display remains on the base frequency for the display (I guess I was expecting it to quickly jump to the frequency where my particular input pane is set). I don't know if this is some sort of "split frequency" operation on the radio (I am still learning about the radio) or is just plain wrong!

Ah...found my own answer. The problem had nothing to do with the freq showing on the dial...and to answer my own question...no, the freq on the dial does not seem to need to change.

>>>I'm glad you got it sorted, Peter. Your transceiver frequency does not need to change because your transceiver's passband is roughly 3 khz wide; when using upper sideband with the suppressed carrier at 14070, WinWarbler can demodulate and generate PSK tones anywhere between 14070.5 and 14073.5.

>>>If you have any other questions or concerns, I'll be happy to give you a hand.

32203. Re: FT897 AND HRD

Bryan,

I think the setup you're considering will work OK. I don't use my FT-897D for data modes any more, so I can't say for certain. The only caveat would be that there is no hardware PTT. My 746Pro requires a hardware PTT to use the rear data connector, but I think the FT897D will work OK with CAT PTT.

As for the differences between interfaces, opinions vary about like Ford vs Chevy. :-) Here's some of the basics.

1. Most interfaces provide transformer isolation of the audio paths which reduces the likelihood of ground loops and noise. The 897 is better about this than some radios, but you can never be too careful.

2. Most interfaces include a hardware PTT, which is required by some radios and software. Some even include a VOX circuit for PTT simplifying setup. BTW, with a hardware PTT, CAT control is not necessary at all for digital modes. Software like HRD use CAT to read radio frequency for the log entries, which is nice, but not required. All you really need is TX & RX audio paths and PTT.

3. Some interfaces include a good sound card separate from the computer's main sound card. This can mean a cleaner signal and more reliable decoding. It also leaves the main computer sound card available to make all the Windows sounds via a speaker and prevents them from going out over the air accidentally.

4. Some interfaces include front panel knobs to control TX and RX levels, which can be more convenient than software sliders.

5. Some interfaces provide mic/data switching while connecting the sound card via the radio's mic connector. This can be useful if you intend to play recorded audio over the air such as with a contest voice memory keyer. Some even provide switching between multiple radios.

Experimentation is half the fun of ham radio. I'd suggest starting simple, like you're doing, and work your way up to the more complicated solutions. I started by making up a cable just like the one you linked above. Then I added isolation transformers when I encountered hum on a different computer, and when I switched radios, I added PTT.

Have a Happy New Year!

> What is the difference between using something like that and and something like a signalink+ or rigblaster pro? I'm just wondering if I need to spend the money of an interface device of if I just need the cables and what exact benefits the interfaces offer over just cables. Also if it's better to go with an interface is there a comparison chart somewhere to help me decide which will be best for me based on how I want to use it?

In fact, remote control is not required for digital modes at all if you're willing to adjust the radio's frequency, mode, etc. manually.
> >
> > In order to work the digital sound card modes, you will need some interface between the radio and the computer's sound card. The interface provides a transmit audio path from the sound card speaker output to the radio's mic or data input, a receive audio path from the radio's speaker or data out to the sound card's mic or aux in, and some method for activating PTT. Some commercial interfaces have their own built-in sound cards while others provide isolation between your sound card and radio to prevent ground loops and a PTT function.

understanding was that if you have a good sound car you don't need something like a rigblaster, but jus the CAT CT-62 cable, is that correct?
